## 0 . Introduction

The purpose of this paper is to prove the following result (cf. Theorem 2.1, below) :
Let $G$ be a semi-simple algebraic group defined over an algebraically closed field $k$, strictly isogenous to a product of groups of type $\mathbf{A}_{n}, \mathbf{B}_{n}, \mathbf{C}_{n}, \mathbf{D}_{n}$ or $\mathbf{G}_{2}$ and L a line bundle
on $G / B$ ( $B$ a Borel subgroup of G.). Then

$$
H^{i}(\mathrm{G} / \mathrm{B}, \mathrm{~L})=0\left\{\begin{array}{c}
i>0  \tag{1}\\
\mathrm{~L} \text { in the dominant chamber. }
\end{array}\right.
$$

When the characteristic of $k$ is 0 , this result is a particular case of a stronger theorem of Bott (cf. [5], [10] or [17]) which asserts that for any semi-simple algebraic group G, given a line bundle L on $\mathrm{G} / \mathrm{B}$, there exists at most one $i$ which can be computed such that $H^{i}(G / B, L) \neq 0$, etc. This stronger result is however now known to be false in arbitrary characteristic, as has been pointed out by Mumford [SL (3), characterisric 2].

A development which has contributed to the proof of (1) is the result proved recently by several authors (cf. [14], [16], [18] and [20]) that the vertex of the cone over the Grassmannian, for its canonical Plücker imbedding into a projective space, is CohenMacaulay; this result is easily seen to be a consequence of (1) for the case $G=\operatorname{SL}(n)$. A common aspect of all these proofs is that they suggest the plausibility of vanishing theorems of type (1) more generally for Schubert varieties (we call Schubert varieties the closures of cells in $G / B, G / P$, etc.) so that (1) could be proved by induction on the dimension of the Schubert varieties. In fact it has been proved by these authors that the vertex of the cone over any Schubert variety in the Grassmannian is Cohen-Macaulay. Among the several proofs of these results there are really two which are different in principle. The first one (cf. [14], [18] and [20]) is based on induction on the dimension of the Schubert varieties and uses a result of Hodge which gives an explicit basis for $H^{\circ}\left(X, L^{m}\right)$ where $X$ is a Schubert variety and $L$ represents the restriction to $X$ of the hyperplane bundle on the Grassmannian for the Plücker imbedding into a projective space. The second proof is due to Kempf ( $c f$. [16]) who deduces these as consequences of theorems of type (1) for a certain class of smooth Schubert varieties in SL (n)/B; in particular he proves (1) for the case $G=\operatorname{SL}(n)$. In this proof one again uses induction on the dimension of these Schubert varieties and the role of Hodge's theorem is replaced by using certain properties of a $\mathbf{P}^{1}$-fibration of $G / B$. Our proof of (1) is inspired from this proof due to Kempf for the case $G=\operatorname{SL}(n)$.

The proof of (1) is done by checking it separately for type $\mathbf{A}_{n}, \mathbf{B}_{n}, \mathbf{C}_{n}, \mathbf{D}_{n}$ and $\mathbf{G}_{2}$; however the underlying principle of the proofs is the same in all the cases.

To give an outline of the proof of (1), let us first give our version of Kempf's proof for the case $G=S L(n+1)$. Fix a maximal torus $T$ of $G$, and a Borel subgroup $B$ of $G, B \supset T$. Take the maximal parabolic subgroup P of $\mathrm{G}, \mathrm{P} \supset \mathrm{B}$, corresponding to the left end root in the Dynkin diagram of G so that $\mathrm{P} \backslash \mathrm{G}$ (= space of cosets of the forme $\mathrm{P} g, g \in \mathrm{G}$ ) is the projective space of dimension $n$. Now B determines a Bruhat decomposition in G , $P \backslash G, B \backslash G$ and $G / B$ and we call Schubert varieties the closures of the corresponding Bruhat cells. Let $\mathrm{P} \backslash \mathrm{G}=\mathrm{Y}_{0} \supset \mathrm{Y}_{1} \supset \ldots \supset \mathrm{Y}_{n}(=$ point $)$ be the decreasing sequence of Schubert varieties in $P \backslash G$. Then $Y_{i}$ is a linear subspace of codimention $i$ in $P \backslash G$ and if $H$ is the tautological line bundle on $P \backslash G$, then the line bundle on $Y_{i}$ determined by the codimension one subvariety $\mathrm{Y}_{i+1}$ is $\left.\mathrm{H}\right|_{\mathrm{Y}_{i}}$. Let $\mathrm{X}_{i}^{\prime}, 0 \leqq i \leqq n$, be the inverse images of $\mathrm{Y}_{i}$ by the canonical morphism $\pi: B \backslash G \rightarrow P \backslash G$; then $X_{i}^{\prime}$ are smooth Schubert varieties in $B \backslash G$ and $\left.\pi^{*}(H)\right|_{\mathbf{x}_{i}^{\prime}}$ is the line bundle defined by the codimension one subvariety $X_{i+1}^{\prime}$ of $X_{i}^{\prime}$. Let $X_{i}$

$$
4^{\mathrm{e}} \text { SÉRIE - TOME } 7-1974-\mathrm{N}^{\circ} 1
$$

be the Schubert varieties in $G / B(=$ space of cosets of the form $g B, g \in G)$ defined by $X_{i}^{\prime}$ (i. e. if $\mathrm{X}_{i}^{\prime}$ is the image in $\mathrm{B} \backslash \mathrm{G}$ of $\overline{\mathrm{B} w \mathrm{~B}} \subset \mathrm{G}, w \in \mathrm{~W}=$ Weyl group of G , then $\mathrm{X}_{i}$ is the canonical image of $\overline{\mathrm{B}} w \mathrm{~B}$ in $\mathrm{G} / \mathrm{B}$ ). We see easily that $\mathrm{X}_{i}$ are also smooth Schubert varieties in G/B. Further $X_{n}=P / B$-the flag variety of $\operatorname{SL}(n)$ (i. e. the flag variety in lower rank). Let $L_{i}$ be the line bundle on $X_{i}$ determined by the codimension one subvariety $X_{i+1}$, then it can be seen that $L_{i}$ are induced from line bundles on $G / B$; further if $L_{i}=L\left(\chi_{i}\right)$ where $\chi_{i}$ is a character of the maximal torus T , the $\chi_{i}$ can be calculated explicitly in terms of the fundamental weights (cf. Proposition A.6, §3, below). We have exact sequences

$$
0 \rightarrow \mathrm{~L}_{i}^{-1} \rightarrow \mathcal{O}_{\mathbf{X}_{i}} \rightarrow \mathcal{O}_{\mathbf{X}_{i+1}} \rightarrow 0
$$

Let $\chi$ be a character of $T, L(\chi)$ the line bundle on $G / B$ defined by $\chi$ and $L=\left.L(\chi)\right|_{\mathrm{x}_{i}}$. Tensoring the above exact sequence by L gives the exact sequence

$$
\begin{equation*}
\left.0 \rightarrow \mathrm{~L} \otimes \mathrm{~L}_{i}^{-1} \rightarrow \mathrm{~L} \rightarrow \mathrm{~L}\right|_{\mathrm{x}_{i+1}} \rightarrow 0 \quad \text { on } \quad \mathrm{X}_{i} . \tag{2}
\end{equation*}
$$

Now it can be seen that there exists a $\mathbf{P}^{1}$-fibration of $X_{i}$ induced by the $\mathbf{P}^{1}$-fibration $\mathrm{G} / \mathrm{B} \rightarrow \mathrm{G} / \mathrm{P}_{\alpha_{i}}$, where $\mathrm{P}_{\alpha_{i}}$ is the minimal parabolic subgroup corresponding to a certain simple root $\alpha_{i}$ (cf. Remark A.3, §3, below). If N is a line bundle on $\mathbf{X}_{i}$, we call $\operatorname{deg} \mathrm{N}=$ degree of $N$ with respect to this $\mathbf{P}^{1}$-fibration, the degree of the restriction of N to any fibre of this fibration. A general reasoning shows (cf. Proposition 1.14, below) that if $\operatorname{deg} \mathrm{N}=-1$, then $\mathrm{H}^{j}\left(\mathrm{X}_{i}, \mathbf{N}\right)=0, j \geqq 0$. It can be shown that $\operatorname{deg} \mathrm{L}_{i}=1$ so that $\operatorname{deg} \mathrm{L} \otimes \mathrm{L}_{i}^{-1}=\operatorname{deg} \mathrm{L}-1$. Writing the cohomology exact sequence of (2), we have

$$
\begin{align*}
0 & \rightarrow \mathrm{H}^{0}\left(\mathrm{X}_{i}, \mathrm{~L} \otimes \mathrm{~L}_{i}^{-1}\right) \rightarrow \mathrm{H}^{0}\left(\mathrm{X}_{i}, \mathrm{~L}\right) \rightarrow \mathrm{H}^{0}\left(\mathrm{X}_{i+1},\left.\mathrm{~L}\right|_{\mathrm{x}_{i+1}}\right)  \tag{3}\\
& \rightarrow \mathrm{H}^{1}\left(\mathrm{X}_{i}, \mathrm{~L} \otimes \mathrm{~L}_{i}^{-1}\right) \rightarrow \mathrm{H}^{1}\left(\mathrm{X}_{i}, \mathrm{~L}\right) \rightarrow \mathrm{H}^{1}\left(\mathrm{X}_{i+1},\left.\mathrm{~L}\right|_{\mathrm{x}_{i+1}}\right) \rightarrow \mathrm{H}^{2}\left(\mathrm{X}_{i}, \mathrm{~L} \otimes \mathrm{~L}_{i}^{-1}\right) \rightarrow \ldots
\end{align*}
$$

We have seen that

$$
\begin{equation*}
\mathrm{H}^{1}\left(\mathrm{X}_{i}, \mathrm{~L} \otimes \mathrm{~L}_{i}^{-1}\right)=0 \quad \text { if } \quad \operatorname{deg} \mathrm{L}=0 \tag{4}
\end{equation*}
$$

Let us now call $\mathrm{L}(\chi)$ dominant if $\chi$ is dominant. Then from the explicit computations of $\chi_{i}$ the following is an immediate consequence :

$$
\begin{align*}
& \mathrm{L}(\chi) \text { dominant and } \operatorname{deg} \mathrm{L} \geqq 1\left[\mathrm{~L}=\left.\mathrm{L}(\chi)\right|_{\mathrm{x}_{i}}\right]  \tag{5}\\
& \quad \Rightarrow \mathrm{L}\left(\chi-\chi_{i}\right)=\mathrm{L}(\chi) \otimes \mathrm{L}\left(-\chi_{i}\right) \text { is dominant. }
\end{align*}
$$

Note that $\mathrm{L} \otimes \mathrm{L}_{i}^{-1}=\left.\mathrm{L}\left(\chi-\chi_{i}\right)\right|_{\mathrm{X}_{i}}$. The proof of (1) now follows as a special case ( $i=0$ ) of the following assertion

$$
\begin{equation*}
\mathrm{H}^{j}\left(\mathrm{X}_{i}, \mathrm{~L}\right)=0, \quad j>0, \quad \mathrm{~L}(\chi) \text { dominant } \tag{6}
\end{equation*}
$$

Since $X_{n}=$ the flag variety in lower rank, by induction on the rank we can suppose (6) to be true this case. We now prove (6) by induction on $\operatorname{dim} X_{i}$ so that we can suppose (6) to be true for $X_{i+1}$ instead of $X_{i}$. Suppose now $\operatorname{deg} L=0$. Then looking at the cohomology exact sequence (3), the assertion (6) follows in this case using (4) above [and of course (6) for the case $X_{i+1}$ ]. Again looking at the exact sequence (3), because of (5) the assertion (6) follows by induction on $\operatorname{deg} \mathrm{L}$.

It can be asked why one should work with $X_{i}$ rather than $X_{i}^{\prime}$ which seems more natural. If we argue by induction on dimension of $X_{i}^{\prime}$, we require a result similar to (4). What is required is a $\mathbf{P}^{1}$-fibration of $X_{i}^{\prime}$ such that the degree of the line bundle on $X_{i}^{\prime}$ which defines the codimension one subvariety $X_{i+1}^{\prime}$ is 1 . Now $X_{i}^{\prime}$ has many $\mathbf{P}^{1}$-fibrations but the degree turns out to be zero in all these cases. This is the reason why we work with $\mathbf{X}_{i}$. In the proofs of the Cohen-Macaulay property of cones over Grassmannians, the proof of something similar to (4) is one of the essential steps and it is achieved with the help of Hodge's basis theorem (loc. cit.). Perhaps a suitable generalisation would also work in this case.

It is now clear how to set about proving (1) for the cases when $G$ is of type other than $\mathbf{A}_{n}$. We take for P the maximal parabolic subgroup corresponding to the left end root in the Dynkin diagram of $G$ and we define a sequence of Schubert varieties :

$$
\mathrm{G} / \mathrm{B}=\mathrm{X}_{0} \supset \mathrm{X}_{1} \supset \ldots \supset \mathrm{X}_{s}=\mathrm{P} / \mathrm{B}
$$

starting from Schubert varieties $\mathrm{Y}_{0} \supset \ldots \supset \mathrm{Y}_{s}$ in $\mathrm{P} \backslash \mathrm{G}$. For the case of type $\mathbf{C}_{n}$ we find that $\mathrm{P} \backslash \mathrm{G}$ is a projective space and the proof goes through as for type $\mathbf{A}_{n}$.

For type $\mathbf{B}_{n}, \mathrm{P} \backslash \mathrm{G}$ is an odd dimensional quadric and there is a unique Schubert variety in $\mathrm{P} \backslash \mathrm{G}$ in each dimension. One defines the sequences $\mathrm{Y}_{i}, \mathrm{X}_{i}$ as above. They are not in general smooth varieties but they are always normal. In this case a technical complication arises from the fact that $X_{n}$ is not a Cartier divisor in $X_{n-1}$; however $2 X_{n}$ is a Cartier divisor in $X_{n-1}$ given by the restriction to $X_{n-1}$ of a line bundle on $G / B$ which can be explicitly computed. Let $Z$ be the closed subscheme of $\mathrm{X}_{n-1}$ " defined by $2 \mathrm{X}_{n}$ " with underlying set as $X_{n}$. One shows that

$$
\text { Vanishing theorem for } X_{n} \Rightarrow \text { Vanishing theorem for } Z
$$

and

$$
\text { Vanishing theorem for } Z \Rightarrow \text { Vanishing theorem for } X_{n-1}
$$

The rest of the proof is similar to that of type $\mathbf{A}_{n}$.
For the case of type $\mathbf{D}_{n}, \mathrm{P} \backslash \mathrm{G}$ is an even dimensional quadric. Here, in every codimension $i$ except when $i=n-1$, there is precisely one Schubert variety $\mathrm{Y}_{i}$ and when $i=n-1$ there are precisely two, say $Y_{n-1}$ and $Y_{n-1}^{\prime}$. We define the sequence of Schubert varieties $\mathrm{Y}_{0} \supset \mathrm{Y}_{1} \supset \ldots \supset \mathrm{Y}_{2 n-2}$ in $\mathrm{P} \backslash \mathrm{G}$ with $\operatorname{codim} \mathrm{Y}_{i}=i$ and we define the sequence $\mathrm{X}_{i}$ as before and let us denote by $Z$ the Schubert variety in $G / B$ defined by $Y_{n-1}^{\prime}$. Here again there is a technical complication; $X_{n-1}$ is not a Cartier divisor in $X_{n-2}$. However dealing with this case turns out to be simpler than in the case $\mathbf{B}_{n}$. One finds that $X_{n-1} \cup \mathrm{Z}$ is a Cartier divisor in $X_{n-2}$ defined by a line bundle on $G / B$ which can be explicitly computed. One finds that $X_{n-1} \cap Z=X_{n}$ (scheme-theoretically) and by a familiar patching up argument (cf. [20]) one shows that

Vanishing theorems for $X_{n-1}$ and $Z \Rightarrow$ Vanishing theorems for $X_{n-1} \cup Z$
and

$$
\text { Vanishing theorems for } X_{n-1} \cup Z \Rightarrow \text { Vanishing theorems for } X_{n-2}
$$

The rest of the argument is as for type $\mathbf{A}_{n}$.

$$
4^{\text {e }} \text { série - tome } 7-1974-\mathrm{N}^{\circ} 1
$$

For type $\mathbf{G}_{2}$, one finds that $\mathrm{P} \backslash \mathrm{G}$ is a five dimensional quadric and the proof goes through as for type $\mathrm{B}_{n}$.

From the preceding it is clear as to what is required for the above proof to go through for the remaining types. Let $P$ be a maximal parabolic subgroup such that $P \backslash G$ is the simplest. Let X be a Schubert variety in $\mathrm{P} \backslash \mathrm{G}$ and S a hyperplane section in $\mathrm{P} \backslash \mathrm{G}$ (for the canonical projective imbedding) such that $X \cdot S$ is set-theoretically a union of Schubert varieties. Then we should know the scheme-theoretic intersection $\mathrm{X} \cdot \mathrm{S}$.

This paper is respectfully dedicated to Professor Cartan whose celebrated theorems on Stein manifolds have influenced so much work on the cohomology of coherent sheaves in analytic and algebraic geometry.

## 1. Preliminaries

Here we set the notation and recall some of the facts needed in the sequel. For details one may consult [1], [3], [6], [7], [8] and [21]-[25]. It would be advisable to skip most of them in the first instance and refer to them only during the course of paragraphs 2 and 3.

We fix an algebraically closed field $k$ of arbitrary characteristic.
Let G denote a connected semi-simple linear algebraic group (over $k$ ) of rank $n$. Let T be a maximal torus of $G$. Let $B \supset T$ be a Borel subgroup of $G$ and let $B^{u}$ denote its unipotent part. Let $N(T)$ be the normaliser of $T$ in $G$ and let $W=N(T) / T$ be the Weyl group of $G$ (relative to $T$ ).

1. System of roots (cf. [1], [3], [6], [7] and [21]). - Let X (T) denote the group of rational characters of T . This is a free abelian group of rank $n$ (= rank G ). Let V be the vector space over $\mathbf{Q}$ defined by $\mathrm{V}=\mathrm{X}(\mathrm{T}) \underset{\mathbf{z}}{\otimes} \mathbf{Q}$. Fix a system of roots $\mathrm{R} \subset \mathrm{X}(\mathrm{T})$ relative to G and T on this vector space. For each root $\alpha \in \mathrm{R}$, let $\theta_{\alpha}$ be the isomorphism of the additive groupe $\mathbf{G}_{a}$ onto a subgroup $H_{\alpha} \subset G$ defined such that

$$
t \theta_{\alpha}(x) t^{-1}=\theta_{\alpha}(\alpha(t) x)
$$

for all $t \in \mathrm{~T}$ and $x \in \mathbf{G}_{a}$. Let $\mathrm{R}^{+}$denote the set of positive roots relative to B , i. e.,

$$
\mathrm{R}^{+}=\left\{\alpha \in \mathrm{R} / \mathrm{H}_{\alpha} \subset \mathrm{B}^{u}\right\} .
$$

Recall that R is a disjoint union of $\mathrm{R}^{+}$and $\mathrm{R}^{-}=-\mathrm{R}^{+}$. We write $\alpha>0$ (resp. $\alpha<0$ ) if $\alpha \in \mathrm{R}^{+}$(resp. $\mathrm{R}^{-}$). Let $\mathrm{S}=\left\{\alpha_{1}, \ldots, \alpha_{n}\right\} \subset \mathrm{R}^{+}$be the simple system of roots. For each $\alpha \in \mathrm{R}$, let $s_{\alpha}$ denote the reflection on V with respect to $\alpha$. Write $s_{i}=s_{\alpha_{i}}$, $1 \leqq i \leqq n . \quad$ Recall that the Weyl group of $G$ (same as the Weyl group of the root system) is generated by the simple reflections $s_{1}, \ldots, s_{n}$. Let (,) be a positive definite scalar product on V invariant under W . Let $\alpha^{*}=2 \alpha /(\alpha, \alpha), \alpha \in \mathrm{R}$. Define $\tilde{\omega}_{i} \in \mathrm{~V}$ such that $\left(\tilde{\omega}_{i}, \alpha_{j}^{*}\right)=\delta_{i j}, 1 \leqq i, j \leqq n$. The $\tilde{\omega}_{1}, \ldots, \tilde{\omega}_{n}$ are called the fundamental weights (relative to $\left.\alpha_{1}, \ldots, \alpha_{n}\right)$. Finally recall that we have $\left(\alpha, \beta^{*}\right) \in \mathbf{Z}, \chi=\sum_{i=1}^{n}\left(\chi, \alpha_{i}^{*}\right) \tilde{\omega}_{i}$ and
$s_{\alpha}(\chi)=\chi-\left(\chi, \alpha^{*}\right) \alpha$ for all $\alpha, \beta \in \mathrm{R}$ and $\chi \in \mathrm{X}(\mathrm{T})$. The integers $n_{i j}=\left(\alpha_{i}, \alpha_{j}^{*}\right)$ are called the Cartan numbers of $G$ (relative to $\alpha_{1}, \ldots, \alpha_{n}$ ).
2. The element $w_{0}$ of $\mathbf{W}$. - Let $l: \mathrm{W} \rightarrow \mathbf{Z}^{+}$denote the usual length function on W relative to $s_{1}, \ldots, s_{n}$, i. e., for $w \in \mathrm{~W}$,

$$
l(w)=\min _{k}\left\{k / w=s_{i_{1}} \ldots s_{i_{k}}, 1 \leqq i_{1}, \ldots, i_{k} \leqq n\right\}
$$

Any expression $w=s_{i_{1}} \ldots s_{i_{k}}$ with $k=l(w)$ is called a reduced expression for $w$. We have the following simple

Proposition 1.1. (cf. [6], p. 43, 158). - There exists a unique element of W , denoted by $w_{0}$, satisfying the following equivalent properties :

$$
\begin{gather*}
l(w) \leqq l\left(w_{0}\right) \text { for all } w \in \mathrm{~W}  \tag{i}\\
l\left(w_{0} w\right)=l\left(w_{0}\right)-l(w) \text { for all } w \in \mathrm{~W} \tag{ii}
\end{gather*}
$$

Remark 1.2. - The Borel subgroup $\tilde{\mathrm{B}}=w_{0} \mathrm{~B} w_{0}^{-1}$ of G , called the Borel subgroup opposite to B (relative to T ) is characterised by the following equivalent properties, namely, $\tilde{B}$ is the Borel subgroup of $G$ such that (i) $B \cap \tilde{B}=T$ or (ii) the roots positive for $B$ are precisely those negative for $\tilde{\mathrm{B}}$.
3. Parabolic subgroups of G containing $\mathbf{B}$ ( $c f$. [3] and [6]). - Let $\mathbf{P}$ denote a parabolic subgroup of $G$ containing $B$. Recall that $P$ is associated to a (unique) subset, say $S_{P}$, of $S$ in the sense that $P$ is the subgroup of $G$ generated by $B$ and the $H_{-\alpha}, \alpha \in R_{P}^{+}$ where $R_{P}^{+}$is the set of all positive roots spanned by the simple roots in $S_{P}$, i.e.,

$$
\mathrm{R}_{\mathrm{P}}^{+}=\left\{\alpha \in \mathrm{R}^{+} / \alpha=\sum_{\beta \in \mathrm{S}_{\mathbf{P}}} n(\beta) \beta\right\}
$$

(Conversely, every subset of $S$ defines a parabolic subgroup of $G$ containing $B$ in an obvious way). Note that $S_{B}=\varnothing$ and $S_{G}=S$. Write $R_{P}^{-}=-R_{P}^{+}$and $R_{P}=R_{P}^{+} \cup R_{P}^{-}$. Finally, recall that we can write $\mathrm{P}=\mathrm{M}_{\mathrm{P}} \cdot \mathrm{U}_{\mathrm{P}}$ (semi-direct product) (called a Levi decomposition for $P$ ) where $M_{P}$ (resp. $U_{P}$ ) is the " reductive part" (resp. unipotent radical) of $P$. In fact, $M_{P}$ is the subgroup of $G$ generated by $T$ and the $H_{\alpha}, \alpha \in R_{P}$ and $U_{P}$ is the subgroup of G generated by the $\mathrm{H}_{\alpha}, \alpha \in \mathrm{R}^{+}-\mathrm{R}_{\mathrm{P}}^{+}$.

For a simple root $\alpha(\in S)$, the parabolic subgroup associated to the subset $\{\alpha\} \subset S$ is denoted by $\mathrm{P}_{\alpha}$ and is referred to as the (minimal) parabolic subgroup associated to $\alpha$. On the other hand the parabolic subgroup associated to the subset $S-\{\alpha\} \subset S$ is denoted by $\mathrm{P}_{\hat{\alpha}}$ and is referred to as the (maximal) parabolic subgroup obtained by omitting $\alpha$.

For a parabolic subgroup $\mathrm{P} \supset \mathrm{B}$, the subgroup of W generated by the $s_{\alpha}, \alpha \in \mathrm{S}_{\mathrm{P}}$ is simply the Weyl group of $P$ (or $\mathrm{M}_{\mathrm{P}}$ ) and is denoted by $\mathrm{W}_{\mathrm{P}}$.
4. Bruhat decomposition of G relative to $\mathbf{P}$ ( $c f$. [3] and [6]). - Let $\mathrm{P} \supset \mathrm{B}$ be a parabolic subgroup of G . For $w \in \mathrm{~W}$, let $n(w) \in \mathrm{N}(\mathrm{T})$ be such that its residue class mod T

$$
4^{\mathrm{e}} \text { série }- \text { Tome } 7-1974 — \mathrm{~N}^{\circ} 1
$$

is $w$. Observe that the $(\mathrm{B}, \mathrm{P})$-double coset $\mathrm{B} n(w) \mathrm{P}$ in G depends only on the coset $w \mathrm{~W}_{\mathbf{P}}$ in W but not on $w$ or $n(w)$. Write $\mathrm{B} w \mathrm{P}$ or $\mathrm{C}_{\mathrm{P}}(w)$ for $\mathrm{B} n(w) \mathrm{P}$ and call it the (open) Bruhat cell in G associated to $w \mathrm{~W}_{\mathrm{P}}$. The Zariski closure of $\mathrm{C}_{\mathrm{P}}(w)$ in G , denoted by $\mathrm{X}_{\mathrm{P}}(w)$, is called the (closed) Bruhat cell in G associated to $w \mathrm{~W}_{\mathrm{P}}$. The Bruhat decomposition of G (relative to P ) asserts that G is the disjoint union of the (open) Bruhat cells $\mathrm{C}_{\mathrm{P}}(w)$ in G . When $\mathrm{P}=\mathrm{B}$, we simply write $\mathrm{C}(w)$ and $\mathrm{X}(w)$ for $\mathrm{C}_{\mathrm{B}}(w)$ and $\mathrm{X}_{\mathrm{B}}(w)$ respectively.

We have a similar description of the Bruhat decomposition of $G$ in terms of the Bruhat cells $\mathbf{P} w \mathrm{~B}, w \in \mathrm{~W}_{\mathrm{P}} \mid \mathrm{W}$.
5. Cellular decomposition of $\mathrm{G} / \mathrm{P}$ (cf. [1], [3], [7] and [8]). - Let $\mathrm{P} \supset \mathrm{B}$ be a parabolic subgroup of G . Let $\mathrm{G} / \mathrm{P}$ denote the space of cosets of the form $g \mathrm{P}, g \in \mathrm{G}$, i. e., the space of orbits in G for the action (by multiplication) of P on the right. Recall that $\mathrm{G} / \mathrm{P}$ is a non-singular projective variety and that the natural projection $\pi_{r}: G \rightarrow G / P$ is a locally trivial principal fibration under the group $P$ (and hence in particular a smooth morphism). For $w \in \mathrm{~W}, \pi_{r}\left(\mathrm{C}_{\mathrm{P}}(w)\right)$ is called the (open) Schubert cell associated to the (open) Bruhat cell $\mathrm{C}_{\mathrm{P}}(w)$. The Schubert cells in $\mathrm{G} / \mathrm{P}$ provide a cellular decomposition of $\mathrm{G} / \mathrm{P}$. In other words, $\mathrm{G} / \mathrm{P}$ is the disjoint union of the Schubert cells $\pi_{r}\left(\mathrm{C}_{\mathrm{P}}(w)\right)$, $w \in \mathrm{~W} / \mathrm{W}_{\mathrm{P}}$. The Zariski closure of $\pi_{r}\left(\mathrm{C}_{\mathrm{P}}(w)\right)$ in $\mathrm{G} / \mathrm{P}$, denoted by $\mathrm{X}_{\mathrm{P}}(w)_{r}$, with the canonical reduced scheme structure, is called the Schubert variety associated to $w \mathrm{~W}_{\mathrm{P}}$. When $\mathrm{P}=\mathrm{B}$, we simply write $\mathrm{X}(w)_{r}$ for $\mathrm{X}_{\mathrm{B}}(w)_{r}$.

Letting $\mathrm{P} \backslash \mathrm{G}$ to denote the space of cosets of the form $\mathrm{P} g, g \in \mathrm{G}$, we have a similar description of the Schubert cells in $\mathrm{P} \backslash \mathrm{G}$, etc. In this case, the notations are as above with $r$ replaced by $l$.
6. Dimension of Schubert cells in G/P. - For $w \in \mathrm{~W}$, let

$$
\mathbf{R}_{\mathbf{P}}(w)=\left\{\alpha>0 / w^{-1}(\alpha) \in \mathbf{R}^{-}-\mathbf{R}_{\mathbf{P}}^{-}\right\} \quad \text { and } \quad \mathbf{N}_{\mathbf{P}}(w)=\operatorname{card} \mathbf{R}_{\mathbf{P}}(w),
$$

and let $\mathrm{H}_{\mathrm{p}}(w)$ denote the subgroup of G generated by the $\mathrm{H}_{\alpha}, \alpha \in \mathrm{R}_{\mathrm{P}}(w)$. Recall that $\mathrm{H}_{\mathrm{P}}(w)$ is a subgroup of $\mathrm{B}^{u}$, and as a variety it is isomorphic to an affine space of dimension $\mathrm{N}_{\mathrm{P}}(w)$. When $\mathrm{P}=\mathrm{B}$ (we agree to omit the suffix B ) note that

$$
\mathrm{R}(w)=\left\{\alpha>0 / w^{-1}(\alpha)<0\right\}
$$

and $\mathrm{H}(w)=\mathrm{B}^{u} \cap w(\tilde{\mathrm{~B}})^{u} w^{-1}$ where $\tilde{\mathrm{B}}=w_{0} \mathrm{~B} w_{0}^{-1}$, etc. Now we prove the following simple

Proposition 1.3.
(i) Given an element $x \in \mathrm{~B} w \mathrm{P}$, there exist $a p \in \mathrm{P}$ and $a$ unique $b \in \mathrm{H}_{\mathrm{P}}(w)$ such that $x=b w p$.
(ii)

$$
\operatorname{dim}\left(X_{\mathbf{P}}(w)_{r}\right)=N_{\mathbf{P}}(w) .
$$

Proof. - Let $\pi_{r}: \mathrm{G} \rightarrow \mathrm{G} / \mathrm{P}$ be the natural morphism. Let $e_{0}=\pi_{r}(\mathrm{P})$ denote the distinguished point in G/P. Consider the natural action of B (induced from that of G ) on $\mathrm{G} / \mathrm{P}$ on the left. Recall that the open Schubert cell $\pi_{r}\left(\mathrm{C}_{\mathrm{P}}(w)\right)$ in $\mathrm{G} / \mathrm{P}$ is simply the
$\mathrm{B}^{u}$-orbit (or B -orbit) through the point $w e_{0}$. It is trivial to see that the isotropy subgroup of $\mathrm{B}^{u}$ at the point $w e_{0}$ is simply $\mathrm{B}^{u} \cap w \mathrm{P} w^{-1}$. But recall that $\mathrm{B}^{u} \cap w \mathrm{P} w^{-1}$ is simply the subgroup of $\mathrm{B}^{u}$ generated by the $\mathrm{H}_{\alpha}$,

$$
\alpha \in \mathrm{R}_{\mathrm{P}}^{\prime}(w)=\left\{\alpha>0 / w^{-1}(\alpha) \in \mathrm{R}_{\mathbf{P}} \cup\left(\mathrm{R}^{+}-\mathrm{R}_{\mathrm{P}}^{+}\right)\right\} .
$$

Note that $\mathrm{R}_{\mathrm{P}}(w)$ and $\mathrm{R}_{\mathrm{P}}^{\prime}(w)$ partition the set $\mathrm{R}^{+}$since $\left(\mathrm{R}^{-}-\mathrm{R}_{\mathrm{P}}^{-}\right)$and $\mathrm{R}_{\mathrm{p}} \cup\left(\mathrm{R}^{+}-\mathrm{R}_{\mathrm{P}}^{+}\right)$ give a partition of the set of all roots. We know that $B^{u}$ as a variety is isomorphic to the direct product $\prod_{\alpha>0} \mathrm{H}_{\alpha}$, the product being taken in any fixed order and as a group it is the product $\mathrm{H}_{\alpha} \ldots \mathrm{H}_{\beta} \ldots \mathrm{H}_{\gamma}$ in that order (cf. [1] or [7, exp. 13]). So writing

$$
\mathrm{B}^{u}=\prod_{\alpha \in \mathbf{R}_{\mathbf{P}}(w)} \mathbf{H}_{\alpha} \times \prod_{\beta \in \mathbf{R}_{\mathbf{P}}^{\prime}(w)} \mathrm{H}_{\beta}=\mathrm{H}_{\mathbf{P}}(w) .\left(\mathrm{B}^{u} \cap w \mathbf{P} w^{-1}\right),
$$

we see that the assertions (i) and (ii) follow immediately.
Note. - In the case of $\mathrm{P} \backslash \mathrm{G}$, we have a similar result, namely,
(i) any element $x \in \mathrm{P} w \mathrm{~B}$ can be written as $x=p w b$ with $p \in \mathrm{P}$ and a unique $b \in \mathrm{H}_{\mathrm{P}}\left(w^{-1}\right)$, and
(ii)

$$
\operatorname{dim}\left(\mathrm{X}_{\mathbf{P}}(w)_{l}\right)=\mathrm{N}_{\mathbf{P}}\left(w^{-1}\right)
$$

[We remark that in general $\mathrm{N}_{\mathrm{P}}(w) \neq \mathrm{N}_{\mathrm{P}}\left(w^{-1}\right)$; however, we will see that $\mathrm{N}(w)=\mathrm{N}\left(w^{-1}\right)$, $c f$. Remark 1.6, below.]
7. Some results of Chevalley (cf. [8]).

Proposition 1.4. - Let $w \in \mathrm{~W}$ and let $\alpha(\in \mathrm{S})$ be a simple root. Then the following statements are equivalent :
(i) The closed Bruhat cell $\mathbf{X}(w)(=\overline{\mathbf{B} w \mathbf{B}})$ in G is stable for multiplication on the left [resp. right] by $\mathrm{H}_{-\alpha}$ or equivalently by the minimal parabolic subgroup $\mathrm{P}_{\alpha}$.

$$
\begin{array}{cc}
l\left(s_{\alpha} w\right)<l(w) & {\left[\text { resp. } l\left(w s_{\alpha}\right)<l(w)\right] .} \\
\mathrm{N}\left(s_{\alpha} w\right)<\mathrm{N}(w) & {\left[\operatorname{resp} . \mathrm{N}\left(w s_{\alpha}\right)<\mathrm{N}(w)\right] .} \\
w^{-1}(\alpha)<0 & {[\operatorname{resp} . w(\alpha)<0] .} \tag{iv}
\end{array}
$$

Proof. - (iii) $\Leftrightarrow$ (iv). - Recall that for $w \in \mathrm{~W}, \mathrm{R}(w)=\left\{\alpha>0 / w^{-1}(\alpha)<0\right\}$ and $\mathrm{N}(w)=$ card $\mathrm{R}(w)$. Suppose $\mathrm{N}\left(s_{\alpha} w\right)<\mathrm{N}(w)$. Assume if possible that $w^{-1}(\alpha)>0$. This gives that $\alpha \in \mathrm{R}\left(s_{\alpha} w\right)$ and that $\alpha \notin \mathrm{R}(w)$. It is easy to check that the reflection $s_{\alpha}$ induces a bijection of $\mathrm{R}(w)$ onto $\mathrm{R}\left(s_{\alpha} w\right)-\{\alpha\}$. Hence $\mathrm{N}(w)=\mathrm{N}\left(s_{\alpha} w\right)-1$ which is a contradiction. Hence (iii) $\Rightarrow$ (iv). Conversely, suppose $w^{-1}(\alpha)<0$. In this case, $\alpha \in \mathrm{R}(w)$ and $\alpha \notin \mathrm{R}\left(s_{\alpha} w\right)$, and consequently, $s_{\alpha}$ induces a bijection of $\mathrm{R}\left(s_{\alpha} w\right)$ onto $\mathbf{R}(w)-\{\alpha\}$. Hence $\mathbf{N}\left(s_{\alpha} w\right)=\mathbf{N}(w)-1$.

Remark 1.5. - Notice that in the above proof we have also established that $w^{-1}(\alpha)>0 \Leftrightarrow \mathrm{~N}\left(s_{\alpha} w\right)=\mathrm{N}(w)+1$. Putting together, we find that

$$
\begin{aligned}
& \qquad \mathrm{N}\left(s_{\alpha} w\right)=\mathrm{N}(w) \pm 1, \quad \forall \alpha \in \mathrm{~S} \quad \text { and } \quad w \in \mathrm{~W} . \\
& 4^{\text {e série }- \text { томе } 7-1974-\mathrm{N}^{o} 1}
\end{aligned}
$$

(ii) $\Leftrightarrow$ (iii). - This is trivial in view of the following.

Claim. - For all $u \in \mathrm{~W}, l(u)=\mathrm{N}(u)$.
We prove this by showing $\mathrm{N}(u) \leqq l(u) \leqq \mathrm{N}(u)$.
$\mathrm{N}(u) \leqq l(u)$. - We prove this by induction on $l(u)$. If $l(u)=0, u=\mathrm{Id}$, and hence $\mathrm{N}(u)=0$. Assume $l(u)>0$ and the induction hypothesis that for all $v \in \mathrm{~W}$,

$$
l(v)<l(u) \Rightarrow \mathrm{N}(v) \leqq l(v) .
$$

Let $u=s_{i_{1}} \ldots s_{i_{r}}, r=l(u)$, be a reduced expression for $u$. Define $v=s_{i_{1}} u$. Notice that $l(v)=l(u)-1$. Hence by induction, we have $\mathrm{N}(v) \leqq l(v)=l(u)-1$. i. e., $\mathrm{N}(v)+1 \leqq l(u)$. But $u=s_{i_{1}} v$ and so by the above remark, we have

$$
\mathrm{N}(u)=\mathrm{N}(v) \pm 1 \leqq \mathrm{~N}(v)+1
$$

Hence $\mathrm{N}(u) \leqq \mathrm{N}(v)+1 \leqq l(u)$. Conversely,
$l(u) \leqq \mathrm{N}(u)$ : We prove this by induction on $\mathrm{N}(u)$. If $\mathrm{N}(u)=0, u=\mathrm{Id}$ and so $l(u)=0$. Assume $\mathrm{N}(u)>0$ (and the induction hypothesis). Hence there exists a positive root $\beta$ such that $w^{-1}(\beta)<0$. We can assume that $\beta$ is simple. Now from the implication (iv) $\Rightarrow$ (iii), we get that $\mathrm{N}\left(s_{\beta} u\right)=\mathrm{N}(u)-1$. By the induction hypothesis, we have

$$
l\left(s_{\beta} u\right) \leqq \mathrm{N}\left(s_{\beta} u\right)=\mathrm{N}(u)-1 .
$$

This means that we can write $s_{\beta} u=s_{i_{1}} \ldots s_{i_{r}}$ with $r=\mathrm{N}(u)-1$. Hence $u=s_{\beta} s_{i_{1}} \ldots s_{i_{r}}$ and so $l(u) \leqq r+1=\mathrm{N}(u)$. Hence $l(u)=\mathrm{N}(u)$.

Remark 1.6. - Note that we have

$$
\operatorname{dim}\left(\mathrm{X}(w)_{r}\right)=\mathrm{N}(w)=l(w)=l\left(w^{-1}\right)=\mathrm{N}\left(w^{-1}\right)=\operatorname{dim}\left(\mathrm{X}(w)_{l}\right) .
$$

(i) $\Leftrightarrow$ (iv). - Let $\pi_{r}: G / B \rightarrow G / P_{\alpha}$ be the canonical morphism. The fibres of $\pi_{r}$ are $\mathrm{P}_{\alpha} / \mathrm{B} \approx \mathbf{P}^{1}$. Observe that for any Schubert variety $\mathrm{X}_{\mathrm{P}_{\alpha}}(w)_{r}$ in $\mathrm{G} / \mathrm{P}_{\alpha}, \pi_{r}^{-1}\left(\mathrm{X}_{\mathrm{P}_{\alpha}}(w)_{r}\right)$ is irreductible in $\mathrm{G} / \mathrm{B}$ and contains $\mathrm{X}(w)_{r}$. It is clear that $\mathrm{X}(w)$ is stable for the multiplication by $\mathrm{P}_{\alpha}$ on the right
$\Leftrightarrow \mathrm{X}(\mathrm{W})_{r}$ is saturated for the $\mathrm{P}^{1}$-fibration $\pi_{r}$
$\Leftrightarrow \mathrm{X}(\mathrm{W})_{r}=\pi_{r}^{-1}\left(\mathrm{X}_{\mathrm{P}_{\alpha}}(w)_{r}\right)$
$\Leftrightarrow \operatorname{dim}\left(\mathrm{X}(w)_{r}\right)=\operatorname{dim}\left(\mathrm{X}_{\mathrm{P}_{\alpha}}(w)_{r}\right)+1$
$\Leftrightarrow \mathrm{N}(w)=\mathrm{N}_{\mathrm{P}_{\alpha}}(w)+1$
$\Leftrightarrow \mathrm{R}(w) \neq \mathrm{R}_{\mathrm{P}_{\alpha}}(w)$ [note that $\mathrm{R}_{\mathrm{P}_{\alpha}}(w) \subseteq \mathrm{R}(w)$ ]
$\Leftrightarrow w(\alpha)<0$.
This completes the proof of the proposition.
8. Partial order on the Weyl group W (relative to B) (cf. [8]). - For $w, w^{\prime} \in \mathrm{W}$, define $w \leqq w^{\prime}$ if $\mathrm{X}(w) \subseteq \mathrm{X}\left(w^{\prime}\right)$. Obviously this defines a partial order on W . We have

Proposition 1.7. - The following statements are equivalent for any two elements $w$, $w^{\prime} \in \mathrm{W}$.

$$
\begin{equation*}
w \leqq w^{\prime} \tag{i}
\end{equation*}
$$

(ii) From every reduced expression for $w^{\prime}$, one can extract a sub-expression which is a reduced expression for $w$.
(iii) There exists some reduced expression for $w^{\prime}$ from which one can extract a sub-expression which is a reduced expression for $w$.

Proof. - This is immediate from the following.
Lemma 1.8. - For any element $w \in \mathrm{~W}$, take a reduced expression for $w=r_{1} \ldots r_{l}$ where $l=l(w)$ and $r_{i} \in \mathbf{S}=\left\{s_{1}, \ldots, s_{n}\right\}$. Define

$$
\mathrm{A}_{w}=\left\{w^{\prime} \in \mathrm{W} / w^{\prime}=r_{i_{1}} \ldots r_{i_{k}} \text { with } 0 \leqq i_{1}<\ldots<i_{k} \leqq l\right\}
$$

Then $\mathrm{A}_{w}$ depends only on $w$ (but not on the reduced expression taken) and we have

$$
\mathrm{X}(w)=\bigcup_{w^{\prime} \in \mathrm{A}_{w}} \mathrm{~B} w^{\prime} \mathrm{B}\left(=\bigcup_{w^{\prime} \in \mathrm{A}_{w}} \mathrm{X}\left(w^{\prime}\right)\right) .
$$

For a proof of this lemma, see [4].
Remark 1.9. - The above proposition together with the lemma enables one (in particular) to recognise the codimension 1 cells contained in $\mathrm{X}(w)$.

Remark 1.10. - Let $w_{0} \in \mathrm{~W}$ be the element of largest length. From Propositions 1.1 and 1.7 and Remark 1.6, we deduce the following :
(i) $\mathrm{X}\left(w_{0}\right)_{r}=\mathrm{G} / \mathrm{B}$ and $\operatorname{dim} \mathrm{G} / \mathrm{B}=l\left(w_{0}\right)=\mathrm{N}\left(w_{0}\right)=$ card $\mathrm{R}^{+}=1 / 2$ number of roots. [The open Schubert cell $\mathrm{C}\left(w_{0}\right)_{r}$ is called the big cell.]
(ii) For all $w \in \mathrm{~W}$, the Schubert variety $\mathrm{X}\left(w_{0} w\right)_{r}$ is of codimension $l(w)$ in $\mathrm{G} / \mathrm{B}$. In particular,
(iii) $\mathrm{X}\left(w_{0} s_{i}\right)_{r}, 1 \leqq i \leqq n$, are (prime) divisors in G/B.
9. The Picard group of G/B (cf. [7], [10] and [12]). - Let $\overline{\mathrm{G}}$ be a simply connected covering of $G$ and let $\bar{T}$ and $\bar{B}$ denote respectively the maximal torus and the Borel subgroup in $\bar{G}$ corresponding to $T$ and $B$ in $G$. Recall that the system of roots for $\bar{G}$ (relative to $\overline{\mathrm{T}}$ ) is the same as the one for G (relative to T ), and that the character group $\mathrm{X}(\overline{\mathrm{T}})$ of $\bar{T}$ is simply the subgroup of $V=X(\bar{T}) \otimes Q=X(T) \otimes Q$ generated by the fundamental weights $\tilde{\omega}_{1}, \ldots, \tilde{\omega}_{n}$. Further, $\overline{\mathrm{G}} / \overline{\mathrm{B}}$ is canonically isomorphic to $\mathrm{G} / \mathrm{B}$. In fact, $\overline{\mathrm{G}} / \overline{\mathrm{P}} \approx \mathrm{G} / \mathrm{P}$ for any parabolic subgroup P in $\mathrm{G}, \overline{\mathrm{P}}$ being the corresponding parabolic subgroup of $\overline{\mathrm{G}}$.

Assume that G is simply connected. For $\chi \in \mathrm{X}(\mathrm{T})$, let $\mathrm{L}(\chi)$ denote the line bundle on $G / B$ associated to the principal $B$-bundle $G \rightarrow G / B$ for the character of $B$ obtained

```
4e}\mathrm{ SÉRIE - TOME 7 - 1974 - No 1
```

by composing $\chi: \mathrm{T} \rightarrow k^{*}$ with the natural map $\mathrm{B} \rightarrow \mathrm{T}=\mathrm{B} / \mathrm{B}^{u}$. This gives a homomorphism

$$
L: \quad X(T) \rightarrow \operatorname{Pic}(G / B)
$$

and recall that this is an isomorphism ( $c f$. [7]). On the other hand, consider the prime divisors $\mathrm{X}\left(w_{0} s_{i}\right)_{r}, 1 \leqq i \leqq n$, on $\mathrm{G} / \mathrm{B}$. Let $\mathrm{L}_{i}=\mathcal{O}_{\mathrm{G} / \mathrm{B}}\left(\mathrm{X}\left(w_{0} s_{i}\right)_{r}\right)$ be the line bundles $\left(^{1}\right)$ defined by $\mathrm{X}\left(w_{0} s_{i}\right)_{r}$. Recall that Pic (G/B) is a free abelian group generated by the $\mathrm{L}_{i}$ 's and that the above isomorphism L is such that $\mathrm{L}\left(\tilde{\omega}_{i}\right)=\mathrm{L}_{i}, 1 \leqq i \leqq n$. In otherwords, for $\chi \in \mathrm{X}(\mathrm{T})$, we have

Finally, recall that we have
(i) $\mathrm{H}^{0}(\mathrm{G} / \mathrm{B}, \mathrm{L}(\chi))=\{$ morphisms $f: \mathrm{G} \rightarrow k / f(g b)=f(g) \chi(b)$ for all $g \in \mathrm{G}$ and $b \in \mathrm{~B}\}$.

Similarly,
$\mathrm{H}^{\mathrm{o}}(\mathrm{B} \backslash \mathrm{G}, \mathrm{L}(\chi))=\left\{\right.$ morphisms $f: \mathrm{G} \rightarrow k / f(b g)=\chi\left(b^{-1}\right) f(g)$ for all $g \in \mathrm{G}$ and $\left.b \in \mathrm{~B}\right\}$.
(ii) $\quad \mathrm{H}^{0}(\mathrm{G} / \mathrm{B}, \mathrm{L}(\chi)) \neq(0) \Leftrightarrow \chi \geqq 0, \quad$ i.e., $\left(\chi, \alpha_{i}^{*}\right) \geqq 0$ for all i.

The set of $\chi$ or $\mathrm{L}(\chi)$ such that $\chi \geqq 0$ is called the dominant chamber or the positive chamber (relative to B ) and it is the «positive» cone generated by the $\tilde{\omega}_{i}$ 's in $\mathrm{X}(\mathrm{T})$.
(iii) The vector space $\mathrm{H}^{\circ}(\mathrm{G} / \mathrm{B}, \mathrm{L}(\chi))$ is canonically a G-module and is indecomposable whenever $\mathrm{L}(\chi)$ is in the dominant chamber. This is so because there exists a unique line in $\mathrm{H}^{0}(\mathrm{G} / \mathrm{B}, \mathrm{L}(\chi))$ stable under the unipotent subgroup $\mathrm{B}^{u}$ of B (cf. [7, Exp. 15], [12]). [If char $k=0$, by a well-known theorem of H . Weyl, representations of G are completely reducible and so $\mathrm{H}^{0}(\mathrm{G} / \mathrm{B}, \mathrm{L}(\chi))$ is an irreductible G-module if $\mathrm{L}(\chi) \geqq 0$.]
(iv) There exists a regular section $f \in \mathbf{H}^{0}\left(\mathrm{G} / \mathrm{B}, \mathrm{L}\left(\tilde{\omega}_{i}\right)\right)$ such that $\mathrm{X}\left(w_{0} s_{i}\right)_{r}$ is the set of zeros of $f$ and further the closed Bruhat cell $\mathrm{X}\left(w_{0} s_{i}\right)$ is precisely the set of zeros of the morphism $f: \mathrm{G} \rightarrow k$ canonically associated to the section $f$. [Similarly, the prime divisor $\mathbf{X}\left(s_{i} w_{0}\right)$ on $\mathrm{B} \backslash \mathrm{G}$ is the set of zeros of some regular section of $\mathrm{L}\left(\tilde{\omega}_{i}\right)$ on $\mathbf{B} \backslash \mathrm{G}$.]

Remark 1.11. - Let $f \in \mathrm{H}^{0}\left(\mathrm{G} / \mathrm{B}, \mathrm{L}\left(\tilde{\omega}_{i}\right)\right)$ be as in (iv) above, i. e., such that $\mathrm{X}\left(w_{0} s_{i}\right)$ is the set of zeros of the morphism $f: \mathrm{G} \rightarrow k$. Then there exists a (unique) $j=j(i)$, $1 \leqq j \leqq n$, such that $f$ satisfies the " double" invariance property, namely,

$$
f\left(b g h^{\prime}\right)=\tilde{\omega}_{j}\left(b^{-1}\right) f(g) \tilde{\omega}_{i}\left(b^{\prime}\right)
$$

for all $b, b^{\prime} \in \mathrm{B}$ and $g \in \mathrm{G}$.
To see this, note that we have $w_{0} s_{i}=s_{j} w_{0}$ for a unique $j=j(i), 1 \leqq j \leqq n . \quad$ As in (iv) above, let $f^{\prime} \in \mathrm{H}^{0}\left(\mathrm{~B} \backslash \mathrm{G}, \mathrm{L}\left(\tilde{\omega}_{j}\right)\right)$ be such that $\mathrm{X}\left(s_{j} w_{0}\right)$ is the set of zeros of the morphism $f^{\prime}: \mathrm{G} \rightarrow k$. Observe that we have $f^{\prime}(b g)=\tilde{\omega}_{j}\left(b^{-1}\right) f^{\prime}(g)$ for all $b \in \mathrm{~B}$ and $g \in \mathrm{G}$. Now $\mathrm{X}\left(s_{j} w_{0}\right)=\mathbf{X}\left(w_{0} s_{i}\right)$ is precisely the set of zeros of the morphism $f$ as well as $f^{\prime}$. Hence the rational function $f / f^{\prime}$ on $G$ is nowhere vanishing on $G$. But then by a well-
${ }^{(1)}$ By a line bundle we mean also the associated invertible sheaf.
known theorem of Rosenlicht, we get that $f / f^{\prime}$ is a (non-zero) scalar in $k$. (One can deduce this also from the considerations of Lemma B.10, § 3, below.)

Proposition 1.12. - Let $\pi_{i}: \mathrm{G} / \mathrm{B} \rightarrow \mathrm{G} / \mathrm{P}_{\alpha_{i}}, 1 \leqq i \leqq n$, be the canonical morphism (note that fibres of $\pi_{i}$ are $\mathrm{P}_{\alpha_{i}} / \mathrm{B} \approx \mathbf{P}_{k}^{1}$ ). Then for any line bundle $\mathrm{L}(\chi)$ on $\mathrm{G} / \mathrm{B}$, the degree of the restriction of $L(\chi)$ to any (and hence every) fibre of $\pi_{i}$ is precisely $\left(\chi, \alpha_{i}^{*}\right)$.

Proof. - Since $\chi=\sum_{j=1}^{n}\left(\chi, \alpha_{j}^{*}\right) \tilde{\omega}_{j}$ and "degree is additive ", the result is immediate in view of the following (well-known and easy).

Assertion. - Let $\pi_{i}$ be as above. For each $j, 1 \leqq j \leqq n$, and each $y \in \mathrm{G} / \mathrm{P}_{\alpha ;}$, we have

$$
\left.\mathrm{L}\left(\tilde{\omega}_{j}\right)\right|_{\pi_{i}^{-1}(y)}=\left\{\begin{array}{cl}
\mathcal{O}_{\mathbf{P}_{k}}(1) & \text { if } i=j, \\
0 & \text { otherwise } .
\end{array}\right.
$$

10. $\mathbf{P}^{1}$-fibrations. - Let X and Y be two algebraic varieties and $\pi: \mathrm{X} \rightarrow \mathrm{Y}$ a $\mathbf{P}^{1}$-bundle associated to a vector bundle of rank 2 on Y (in particular, $\pi$ is a locally trivial $\mathbf{P}^{1}$-bundle). Note that this is equivalent to saying that $\pi$ is a $\mathbf{P}^{1}$-fibration and that there exists a line bundle, say $\mathcal{O}(1)$, on X such that its restriction to every fibre of $\pi$ is of degree 1 . This $\mathcal{O}$ (1) is simply the tautological line bundle on X associated to the $\mathrm{P}^{1}$-bundle $\pi$. Let D be a divisor on X and $\mathrm{L}=\mathcal{O}_{\mathrm{X}}(\mathrm{D})$, the line bundle defined by D . Suppose that the restriction of L to any (and hence every) fibre of $\pi$ is of degree $m$. We call $m$ the degree of D or L with respect to the $\mathbf{P}^{1}$-fibration $\pi$. Then we claim that there exists a line bundle M on Y such that $\mathrm{L} \approx \pi^{*}(\mathrm{M}) \otimes \mathscr{O}(m)$ where $\mathcal{O}(m)$ denotes the line bundle $\mathcal{O}(1)^{\otimes m}$. For, by taking $\mathrm{L} \otimes \mathscr{O}(-m)$, it suffices to prove that if L is a line bundle on X such that its restriction to all the fibres of $\pi$ are trivial, then $\mathrm{L} \approx \pi^{*}(\mathrm{M})$ for some line bundle M on Y but this is well-known (cf. [19]).

Suppose now that Y is normal. Let $\mathrm{Y}_{0}$ be the open subscheme of smooth points of Y . Then $\mathrm{X}_{0}=\pi^{-1}\left(\mathrm{Y}_{0}\right)$ is the open subscheme of smooth points of X . Let D be a Weil divisor on X , i. e., a formal integral linear combination of closed irreducible subvarieties of codimension 1 in X . Let $\mathscr{D}$ be the sheaf associated to D , i. e., the $\mathcal{O}_{\mathrm{x}}$-submodule of the sheaf $\mathscr{R}$ of rational functions on X defined by

$$
\mathrm{H}^{0}(\mathrm{U}, \mathscr{D})=\left\{f \in \mathrm{H}^{0}(\mathrm{U}, \mathscr{R}) / \operatorname{div} f+\left.\mathrm{D}\right|_{\mathrm{U}} \geqq 0\right\}
$$

for every open subset U in X . Let $\mathscr{D}_{0}$ be the line bundle on $\mathrm{X}_{0}$ associated to the divisor $\mathrm{D}_{0}=\left.\mathrm{D}\right|_{\mathrm{x}_{0}}$ on $\mathrm{X}_{0}$. We see easily that $\mathscr{D}=i_{*}\left(\mathscr{D}_{0}\right)$ where $i$ is the open immersion $\mathrm{X}_{0} \leftrightarrows \mathrm{X}$, or equivalently, $\mathscr{D}$ is the maximal $\mathcal{O}_{\mathrm{x}}$-submodule of $\mathscr{R}$ such that $\left.\mathscr{D}\right|_{\mathrm{x}_{0}}=\mathscr{D}_{0}$. On the other hand we see that if $\mathscr{D}_{0}$ is the $\mathcal{O}_{\mathbf{X}_{0}}$-submodule of $\left.\mathscr{R}\right|_{\mathrm{X}_{0}}$ associated to the divisor $\mathrm{D}_{0}$ on $\mathrm{X}_{0}$, then $\mathscr{D}=i_{*}\left(\mathscr{D}_{0}\right)$ is the $\mathcal{O}_{\mathrm{x}}$-submodule of $\mathscr{R}$ associated to the Weil divisor $\mathrm{D}=\overline{\mathrm{D}}_{0}$ (closure of $\mathrm{D}_{0}$ in X ) on X . We define the degree of D (or $\mathscr{D}$ ) with respect to the $\mathbf{P}^{1}$-fibration $\pi$ to be the degree of $\mathrm{D}_{0}$ with respect to the $\mathbf{P}^{1}$-fibration $\left.\pi\right|_{\mathrm{x}_{0}}$. Let $m$ be the degree of D with respect to $\pi$. Then we claim that there exists a Weil divisor E on Y such that if $\mathscr{E}$ is the sheaf on Y associated to E , then

$$
\mathscr{D} \approx \pi^{*}(\mathscr{E}) \otimes \mathscr{O}(m) .
$$

$$
4^{\mathrm{e}} \text { SÉRIE - TOME } 7-1974-\mathrm{N}^{\mathrm{o}} 1
$$

To see this, note that we have an isomorphism (from what we have seen above) on $X_{0}$, namely,

$$
\mathscr{D}_{0} \approx \pi^{*}\left(\mathscr{E}_{0}\right) \otimes \mathscr{O}(m)
$$

for some line bundle $\mathscr{E}_{0}$ on $\mathrm{Y}_{0}$. Now extend the divisor $\mathrm{E}_{0}$ on $\mathrm{Y}_{0}$ (whose associated line bundle is $\mathscr{E}_{0}$ ) to the Weil divisor E on Y, etc. and observe that $\mathscr{D}$ and $\pi^{*}(\mathscr{E}) \otimes \mathscr{O}(m)$ are completely determined by their restrictions to $\mathrm{X}_{0}$ and hence the claim follows.

Let $\alpha$ ( $=\alpha_{i}$ for some $i$ ) be a simple root and let $\pi: G / B \rightarrow G / P_{\alpha}$ be the canonical morphism. Note that this $\mathbf{P}^{1}$-fibration $\pi$ is a $\mathbf{P}^{1}$-bundle associated to a vector bundle of rank 2 on $G / P_{\alpha}$ because, by Proposition 1.12, the line bundle $\mathcal{O}(1)=L\left(\tilde{\omega}_{i}\right)$ on $\mathrm{G} / \mathrm{B}$ is such that its restriction to all the fibres of $\pi$ are of degree 1 . In particular, if $\mathbf{X}$ is a subvariety (for example, a Schubert variety) of $G / B$ saturated for the $\mathbf{P}^{1}$-fibration $\pi$ and $\mathrm{Y}=\pi(\mathrm{X})$, then we find that $\pi: \mathrm{X} \rightarrow \mathrm{Y}$ is again a $\mathbf{P}^{1}$-bundle associated to a vector bundle of rank 2 on $Y$ (namely, the restriction to $Y$ of the one defining $\pi: G / B \rightarrow G / P_{\alpha}$ ). Thus we have proved the following

Proposition 1.13. - Let X be a Schubert (resp. normal Schubert) variety in G/B saturated for the $\mathbf{P}^{1}$-fibration $\pi: \mathrm{G} / \mathrm{B} \rightarrow \mathrm{G} / \mathrm{P}_{\alpha}, \alpha$ a simple root, and let $\mathrm{Y}=\pi(\mathrm{X})$. Let D be a divisor (resp. Weil divisor) on X of degree $m$ with respect to $\pi: \mathrm{X} \rightarrow \mathrm{Y}$. Then there exists a divisor (resp. Weil divisor) E on Y such that

$$
\mathscr{D} \approx \pi^{*}(\mathscr{E}) \otimes \mathscr{O}(m)
$$

where $\mathscr{D}$ and $\mathscr{E}$ are the sheaves associated to D and E respectively.
Now we prove the following
Proposition 1.14. - Let the notation and hypothesis be as in the above proposition. Assume that $m=-1$. Then

$$
\mathrm{H}^{i}(\mathrm{X}, \mathscr{D})=0 \quad \text { for all } i \geqq 0
$$

Proof. - Observe that we have $\mathrm{R}^{j} \pi_{*}(\mathscr{D})=0$ for all $j \geqq 0$. For, the question being local with respect to the base Y and $\pi$ is a locally trivial $\mathbf{P}^{1}$-bundle, we can assume that $\pi$ is actually trivial, i. e., X is of the form $\mathrm{Y} \times \mathbf{P}^{1}$. Now by the Künneth formula, we have

$$
\mathrm{H}^{j}\left(\mathrm{Y} \times \mathbf{P}^{1}, \pi^{*}(\mathscr{E}) \otimes \mathscr{O}(-1)\right) \approx \sum_{j_{1}+j_{2}=j} \mathrm{H}^{j_{1}}(\mathrm{Y}, \mathscr{E}) \otimes \mathrm{H}^{j_{2}}\left(\mathbf{P}^{1}, \mathcal{O}_{\mathbf{P}^{1}}(-1)\right)
$$

which is zero because $H^{*}\left(\mathbf{P}^{1}, \mathcal{O}_{\mathbf{P}^{1}}(-1)\right)=0$. Thus we see that $H^{j}\left(\mathrm{U},\left.\mathscr{D}\right|_{\mathrm{U}}\right)=0$ for all $j \geqq 0$ and all open sets U in X . Hence it follows that $\mathrm{R}^{j} \pi_{*}(\mathscr{D})=0$ for all $j \geqq 0$.

But now the Leray spectral sequence

$$
\mathrm{H}^{i}\left(\mathrm{Y}, \mathrm{R}^{j} \pi_{*}(\mathscr{D})\right) \Rightarrow \mathrm{H}^{i+j}(\mathrm{X}, \mathscr{D})
$$

degenerates and so $\left[\right.$ since $\mathrm{R}^{0} \pi_{*}(\mathscr{D})=0$ ] we get

$$
\mathrm{H}^{i}\left(\mathrm{Y}, \mathrm{R}^{0} \pi_{*}(\mathscr{D})\right)=\mathrm{H}^{i}(\mathrm{X}, \mathscr{D})=0
$$

for all $i \geqq 0$ as required.
As an immediate consequence of Propositions 1.12 and 1.14 , we have the following

Corollary 1.15. - Let $w \in \mathrm{~W}$ be such that $\mathrm{X}(w)$ is stable for multiplication on the right by $\mathrm{P}_{\alpha_{i}}$ for some simple root $\alpha_{i}\left[\right.$ i. e., the Schubert variety $\mathrm{X}(w)_{r}$ is saturated for the $\mathbf{P}^{1}$-fibration $\pi: \mathrm{G} / \mathrm{B} \rightarrow \mathrm{G} / \mathrm{P}_{\alpha_{i}}$ ]. Then for all line bundles $\mathrm{L}(\chi)$ on $\mathrm{G} / \mathrm{B}$ such that $\left(\chi, \alpha_{i}^{*}\right)=-1$, we have

$$
\mathrm{H}^{j}\left(\mathrm{X}(w)_{r},\left.\mathrm{~L}(\chi)\right|_{\left.\mathrm{X}(w)_{r}\right)}\right)=0 \text { for all } j \geqq 0 .
$$

## 2. The Main Theorem and its Consequences

Theorem 2.1. - Let G be a connected semi-simple algebraic group (of rank m) strictly isogenous (cf. [24]) to a product of groups of type $\mathbf{A}_{n}, \mathbf{B}_{n}, \mathbf{C}_{n}, \mathbf{D}_{n}$ or $\mathbf{G}_{2}$. Let B be a Borel subgroup of G . Then for every line bundle $\mathrm{L}(\chi)$ on $\mathrm{G} / \mathrm{B}$ belonging to the dominant chamber, we have

$$
\mathrm{H}^{i}(\mathrm{G} / \mathrm{B}, \mathrm{~L}(\chi))=0 \text { for all } i \geqq 1
$$

We prove this theorem in the next article. However, we deduce some of its immediate consequences below. We keep the notation and hypothesis as in the theorem.

Corollary 2.2. - Let G be as above. For every line bundle $\mathrm{L}\left(\chi^{\prime}\right)$ on $\mathrm{G} / \mathrm{B}$ such that $\chi^{\prime}+\rho \geqq 0$, where $\rho=\tilde{\omega}_{1}+\ldots+\tilde{\omega}_{m}=$ half sum of the positive roots $(c f .[6], \mathrm{p} .168)$, we have

$$
\mathrm{H}^{i}\left(\mathrm{G} / \mathrm{B}, \mathrm{~L}\left(\chi^{\prime}\right)\right)=0 \quad \text { for all } i \geqq 1
$$

(This corollary shows that the above theorem is valid for a wider class of line bundles on $G / B$, namely, the dominant chamber translated by $-\rho$.)

Proof. - Clearly it suffices to consider the case of a $\chi^{\prime}$ such that $\left(\chi^{\prime}, \alpha_{j}^{*}\right)=-1$ for some $j$. In this case Corollary 1.15 (applied to the big cell) gives the required result.

Corollary 2.3. - Let G be as above. The dimension of the vector space $\mathrm{H}^{0}(\mathrm{G} / \mathrm{B}, \mathrm{L}(\chi))$, $\chi \geqq 0$, is independent of the characteristic of the base field $k$, consequently, its value is explicitly known as given by Weyl's dimension formula in characteristic 0 (cf. [11] and [17]).

Proof. - This is an immediate consequence of the semi-continuity theorem (cf. [19]) and " reduction $\bmod p$ " because G/B is " defined over $\mathbf{Z} "$ " $\left(c f\right.$. [13]) and $H^{1}(\mathrm{G} / \mathrm{B}, \mathrm{L}(\chi))=0$.

Corollary 2.4. - Let G be as above. For every line bundle $\mathrm{L}(\chi)$ with $\chi>0$, we have

$$
\mathrm{H}^{i}(\mathrm{G} / \mathrm{B}, \mathrm{~L}(-\chi))=0 \quad \text { for } \quad 0 \leqq i<\operatorname{dim} \mathrm{G} / \mathrm{B}
$$

Proof. - This follows easily from Serre's duality theorem on G/B. It is not difficult to see that the canonical class $K$ on $G / B$ is precisely the line bundle $K=L(-2 \rho)$ where $\rho\left(=\tilde{\omega}_{1}+\ldots+\tilde{\omega}_{m}\right)$ is half sum of the positive roots. Now by Serre's duality theorem, we have (for all $i \geqq 0$ ) :

$$
\mathrm{H}^{i}(\mathrm{G} / \mathrm{B}, \mathrm{~L}(-\chi)) \approx \mathrm{H}^{\mathrm{N}-i}(\mathrm{G} / \mathrm{B}, \mathrm{~L}(\chi-2 \rho))^{\prime}
$$

where' denotes the vector space dual and $N=\operatorname{dim} G / B$. Thus we have only to prove that

$$
\mathrm{H}^{j}(\mathrm{G} / \mathrm{B}, \mathrm{~L}(\chi-2 \rho))=0 \text { for all } j>0
$$

But this follows from Corollary 2.2 because we have $(\chi-2 \rho)+\rho=\chi-\rho \geqq 0$ (since $\chi>0$ ).

Corollary 2.5. - Let G be as above. For every projective imbedding of $\mathrm{G} / \mathrm{B}$ defined by a very ample line bundle $\mathrm{L}(\chi), \mathrm{G} / \mathrm{B}$ is arithmetically (i.e. the cone over $\mathrm{G} / \mathrm{B}$ is) normal and Cohen-Macaulay.

Proof. - Since G/B is non-singular, recall that the arithmetic normality of G/B for the imbedding defined by $\mathrm{L}(\chi)$ is equivalent to proving that the natural homomorphisms

$$
\varphi_{r}: \quad\left(\mathrm{H}^{0}(\mathrm{G} / \mathrm{B}, \mathrm{~L}(\chi))\right)^{\otimes r} \rightarrow \mathrm{H}^{0}(\mathrm{G} / \mathrm{B}, \mathrm{~L}(r \chi))
$$

are surjective for all $r \geqq 1$. To see the surjectivity of $\varphi_{r}$; observe that $\varphi_{r}$ is a G-equivariant map (for the natural action of G on $\mathrm{H}^{0}(\mathrm{G} / \mathrm{B}, \mathrm{L}(r, \chi))$ and the diagonal action on the tensor power of $\mathrm{H}^{0}(\mathrm{G} / \mathrm{B}, \mathrm{L}(\chi))$, and that the result is immediate if char $k=0$ because $H^{0}(G / B, L(r \chi))$ is an irreducible G-module. Since G/B is "defined over $\mathbf{Z}$ ", etc. it follows that, when char $k$ is arbitrary, the dimension of $\operatorname{Im} \varphi_{r}=d_{0}$ where $d_{0}$ is the dimension of the "corresponding module" $\mathrm{H}^{0}(\mathrm{G} / \mathrm{B}, \mathrm{L}(r \chi))$ in char $k=0$. But then by Corollary 2.3, we know that $d_{0}=\operatorname{dim} \mathrm{H}^{0}(\mathrm{G} / \mathrm{B}, \mathrm{L}(r \chi))$ in all characteristics and hence $\varphi_{r}$ is surjective for all $r \geqq 1$.

Now by a theorem of Serre-Grothendieck (cf. [20], p. 160), it follows that G/B is arithmetically Cohen-Macaulay because ( $\chi>0$ and so by Theorem 2.1 and Corollary 2.4) we have

$$
\mathrm{H}^{i}(\mathrm{G} / \mathrm{B}, \mathrm{~L}(r \chi))=0 \quad \text { for } \quad 0<i<\operatorname{dim} \mathrm{G} / \mathrm{B}
$$

and all $r \in \mathbf{Z}$.
Corollary 2.6. - Let G be as above. For all line bundles $\mathrm{L}(\chi)$ and $\mathrm{L}\left(\chi^{\prime}\right)$ on $\mathrm{G} / \mathrm{B}$ belonging to the dominant chamber, the natural homomorphism

$$
\varphi_{\chi, \chi^{\prime}}: \quad H^{0}(\mathrm{G} / \mathrm{B}, \mathrm{~L}(\chi)) \otimes \mathrm{H}^{0}\left(\mathrm{G} / \mathrm{B}, \mathrm{~L}\left(\chi^{\prime}\right)\right) \rightarrow \mathrm{H}^{0}\left(\mathrm{G} / \mathrm{B}, \mathrm{~L}\left(\chi+\chi^{\prime}\right)\right.
$$

is surjective.
Proof. - This is immediate in char $k=0$ because $\varphi_{\chi, \chi^{\prime}}$ is a G-equivariant map and $\mathrm{H}^{0}\left(\mathrm{G} / \mathrm{B}, \mathrm{L}\left(\chi+\chi^{\prime}\right)\right)$ is an irreducible G-module. As in the proof of the above corollay. we easily conclude that in any characteristic $\varphi_{\chi, \chi^{\prime}}$ is surjective.

Remark. - The surjectivity of the map $\varphi_{r}$ in the proof of Corollary 2.5 is itself a particular case of the above corollary. Thus the theory of " reduction $\bmod p$ " and the known information in characteristic zero are used only in the proof of the above corollary. However, it seems possible to prove the above corollary directly in any characteristic by the same procedure that we are going to adopt to prove Theorem 2.1, i. e., by induction on the rank of $G$ as well as on the dimension of a class of Schubert varieties in G/B. But we have not attempted to carry out the details.

[^1]The case of G/P. - Let G be any semi-simple (connected) algebraic group of rank $m$. Let $P \supset B$ be a parabolic subgroup of $G$, say associated to a subset $S_{P}$ of the set $\mathrm{S}=\left\{\alpha_{1}, \ldots, \alpha_{m}\right\}$ of simple roots. Let $\pi: \mathrm{G} / \mathrm{B} \rightarrow \mathrm{G} / \mathrm{P}$ be the natural morphism. It is casy to check that Pic ( $\mathrm{G} / \mathrm{P}$ ) is identified (via $\pi^{*}$ ) with the subgroup of $\operatorname{Pic}(\mathrm{G} / \mathrm{B})$ generated by $\mathrm{L}\left(\tilde{\omega}_{i_{1}}\right), \ldots, \mathrm{L}\left(\tilde{\omega}_{i_{p}}\right)$ where the $i_{1}, \ldots, i_{p}$ are determined by the set

$$
S-S_{P}=\left\{\alpha_{i_{1}}, \ldots, \alpha_{i_{p}}\right\}
$$

complementary to $\mathrm{S}_{\mathrm{p}}$. Let us call a line bundle M on $\mathrm{G} / \mathrm{P}$ " positive " and write $\mathrm{M} \geqq 0$ if $\pi^{*}(\mathrm{M})$ is positive on $\mathrm{G} / \mathrm{B}$. We write $\mathrm{M}>0$ if $\pi^{*} \mathrm{M}=\mathrm{L}(\chi)$ with $\left(\chi, \alpha_{i_{k}}^{*}\right) \geqq 1$ for all $k=1, \ldots, p$. Now we have the following

Theorem 2.7. - Let G be as in Theorem 2.1 and P a parabolic subgroup of G . Let M be a line bundle on $\mathrm{G} / \mathrm{P}$. Then

$$
\begin{equation*}
\mathrm{H}^{i}(\mathrm{G} / \mathrm{P}, \mathrm{M})=0 \text { for all } i \geqq 1 \text { if } \mathrm{M} \geqq 0 \tag{i}
\end{equation*}
$$

and
(ii) $\quad \mathrm{H}^{i}\left(\mathrm{G} / \mathrm{P}, \mathrm{M}^{-1}\right)=0$ for $0 \leqq i<\operatorname{dim} \mathrm{G} / \mathrm{P}$ if $\mathrm{M}>0$, consequently,
(iii) $\mathrm{G} / \mathrm{P}$ is arithmetically normal and Cohen-Macaulay for the imbedding defined by every very ample line bundle.

Proof. - Everything follows as an immediate consequence of the above theorem and its corollaries in view of the following

Claim. - For all line bundles M on $\mathrm{G} / \mathrm{P}$, we have

$$
\mathrm{H}^{i}(\mathrm{G} / \mathrm{P}, \mathrm{M}) \approx \mathrm{H}^{i}\left(\mathrm{G} / \mathrm{B}, \pi^{*} \mathrm{M}\right) \text { for all } i \geqq 0 .
$$

To see this; observe that we have : (a) $\mathrm{R}^{0} \pi_{*} \mathcal{O}_{\mathrm{G} / \mathrm{B}}=\mathcal{O}_{\mathrm{G} / \mathrm{P}}$ and $(b) \mathrm{R}^{j} \pi_{*}\left(\mathcal{O}_{\mathrm{G} / \mathrm{B}}\right)=0$ for all $j \geqq 1$. Since $\mathrm{G} / \mathrm{P}$ is normal and $\pi$ is locally trivial with fibres $\approx \mathrm{P} / \mathrm{B}=$ Complete varieties, we see that (a) is immediate. Since $P$ is of the same type as $G$, we find as a particular case of Theorem 2.1 for P that

$$
\mathrm{H}^{j}\left(\mathrm{P} / \mathrm{B}, \mathcal{O}_{\mathrm{P} / \mathbf{B}}\right)=0 \text { for all } j \geqq 1 .
$$

In other words, the higher cohomology groups of the restriction of $\mathcal{O}_{\mathbf{G} / \mathrm{B}}$ to the fibres of $\pi$ are all zero and hence by the semi-continuity theorem (or directly) (b) follows. Now the Leray spectral sequence of $\pi$ :

$$
\mathrm{H}^{i}\left(\mathrm{G} / \mathrm{P}, \mathrm{R}^{j} \pi_{*}\left(\pi^{*} \mathrm{M}\right)\right) \Rightarrow \mathrm{H}^{i+j}\left(\mathrm{G} / \mathrm{B}, \pi^{*} \mathrm{M}\right)
$$

degenerates because

$$
\mathrm{R}^{j} \pi_{*}\left(\pi^{*} \mathrm{M}\right) \approx \mathrm{R}^{j} \pi_{*}\left(\mathcal{O}_{\mathrm{G} / \mathrm{B}}\right) \otimes \mathrm{M}=0 \quad(\text { for } j \geqq 1)
$$

and hence we get

$$
\begin{aligned}
\mathrm{H}^{i}\left(\mathrm{G} / \mathrm{B}, \pi^{*} \mathrm{M}\right) & =\mathrm{H}^{i}\left(\mathrm{G} / \mathrm{P}, \mathrm{R}^{0} \pi_{*}\left(\pi^{*} \mathrm{M}\right)\right) \\
& =\mathrm{H}^{i}\left(\mathrm{G} / \mathrm{P}, \mathrm{R}^{0} \pi_{*}\left(\mathcal{O}_{\mathrm{G} / \mathrm{B}}\right) \otimes \mathrm{M}\right) \\
& =\mathrm{H}^{i}(\mathrm{G} / \mathrm{P}, \mathrm{M})
\end{aligned}
$$

as required.

## 3. Proof of the Main Theorem

## (Case by case : Type $\mathbf{A}_{n}, \mathbf{B}_{n}, \mathbf{C}_{n}, \mathbf{D}_{n}$ or $\mathbf{G}_{2}$ )

To prove Theorem 2.1, we can assume that G is simple, i. e., G is one of type $\mathbf{A}_{n}, \mathbf{B}_{n}$, $\mathbf{C}_{n}, \mathbf{D}_{n}$ or $\mathbf{G}_{2}$. As is pointed out in the introduction, the method of proof is the same in all the cases. Now we carry out the details case by case (keeping the sequence of the main steps to be in the same order). We give full details in the case when $G$ is of type $\mathbf{A}_{n}$. (Some propositions proved in this case do not use the fact that $G$ is of type $\mathbf{A}_{n}$, i. e., they hold in the other types as well.) Whenever the proof is similar to the case of type $\mathbf{A}_{n}$, we omit the details in the other cases.

## A. Type $\mathbf{A}_{n}$

1. Numerical data. - Recall the following facts for a group $G$ of type $\mathbf{A}_{n}$.

Dynkin diagram :

The Cartan numbers

$$
n_{i j}=\left(\alpha_{i}, \alpha_{j}^{*}\right)=2\left(\alpha_{i}, \alpha_{j}\right) /\left(\alpha_{j}, \alpha_{j}\right)
$$

are given by

$$
n_{i j}=\left\{\begin{aligned}
2 & \text { if } \quad i=j, \\
-1 & \text { if } i=j \pm 1, \\
0 & \text { otherwise } .
\end{aligned}\right.
$$

The number of roots $=n(n+1)$.
The order of the Weyl group $\mathrm{W}\left(=\mathrm{W}\left(\mathrm{A}_{n}\right)\right.$ ) of $\mathrm{G}=(n+1)$ !
2. A reduced expression for $w_{0}$.

Proposition A.1. $-A$ reduced expression for the element $w_{0} \in \mathrm{~W}$ (of largest length) is given by

$$
w_{0}=s_{n}\left(s_{n-1} s_{n}\right) \ldots\left(s_{i} \ldots s_{n}\right) \ldots\left(s_{1} \ldots s_{n}\right) .
$$

Proof. - Write

$$
u_{1}=s_{n}\left(s_{n-1} s_{n}\right) \ldots\left(s_{1} \ldots s_{n}\right)
$$

and note that

$$
l\left(u_{1}\right) \leqq 1+\ldots+n=\frac{1}{2} n(n+1) .
$$

We prove that $u_{1}(\alpha)<0$ for all roots $\alpha>0$. Then by Proposition 1.1 (iii), it would follow that $u_{1}=w_{0}$. But we know that

$$
l\left(w_{0}\right)=\frac{1}{2} n(n+1)=\frac{1}{2} \text { number of roots }
$$

which implies that the given expression for $w_{0}$ is reduced.

Now define inductively two sequences $\left\{v_{i}\right\}$ and $\left\{u_{i}\right\}, 1 \leqq i \leqq n$, of elements in W as follows :

$$
\begin{array}{llll}
\left\{v_{i}\right\}: & v_{n}=s_{n} \text { and } v_{i}=s_{i} v_{i+1}, & & 1 \leqq i<n ; \\
\left\{u_{i}\right\}: & u_{n}=v_{n} \text { and } u_{i}=u_{i+1} v_{i}, & & 1 \leqq i<n .
\end{array}
$$

That $u_{1}(\alpha)<0$ for all roots $\alpha>0$ is a particular case of the following

## Assertion I.

$$
u_{i}\left(\alpha_{j}\right)=\left\{\begin{array}{cl}
-\alpha_{n+i-j} & \text { for } i \leqq j \leqq n, \\
\left(\alpha_{i-1}+\ldots+\alpha_{n}\right) & \text { for } j=i-1, \\
\alpha_{j} & \text { for } j \leqq i-2 .
\end{array}\right.
$$

We prove this by decreasing induction on $i$. For $i=n$, we have $u_{n}=v_{n}=s_{n}$ and the result is trivial. Assume the assertion proved for all $u_{k}, k>i$. Since $u_{i}=u_{i+1} v_{i}$, it is easy to check that the result follows for $u_{i}$ using the values $v_{i}\left(\alpha_{j}\right)$ as given by the following

Assertion II. - We have

$$
v_{i}\left(\alpha_{j}\right)=\left\{\begin{array}{cc}
-\left(\alpha_{i}+\ldots+\alpha_{n}\right) & \text { for } j=n, \\
\alpha_{j+1} & \text { for } i \leqq j \leqq n-1, \\
\alpha_{i-1}+\alpha_{i} & \text { for } j=i-1, \\
\alpha_{j} & \text { for } j \leqq i-2 .
\end{array}\right.
$$

We prove this again by decreasing induction on $i$. For $i=n$, we have $v_{n}=s_{n}$ and the assertion is obvious. Assume the result proved for all $v_{k}, k>i$. Since $v_{i}=s_{i} v_{i+1}$, direct verification proves the assertion.
This completes the proof of the proposition.
3. The Parabolic subgroup $P\left(=P_{\hat{\alpha}}\right.$ ). - Since no confusion is likely, denote by $P$ the maximal parabolic subgroup of $G$ associated to omitting $\alpha_{1}$. It is easy to check that the semi-simple part of P is of type $\mathbf{A}_{n-1}$ and its Dynkin diagram can be canonically taken to be

In particular, the element say $w_{0}^{\prime}$ (of largest length) in the Weyl group $\mathrm{W}_{\mathrm{P}}\left(=\mathrm{W}\left(\mathbf{A}_{n-1}\right)\right)$ of $P$ is given by

$$
w_{0}^{\prime}=s_{n}\left(s_{n-1} s_{n}\right) \ldots\left(s_{i} \ldots s_{n}\right) \ldots\left(s_{2} \ldots s_{n}\right) .
$$

Thus we have $w_{0}=w_{0}^{\prime}\left(s_{1} \ldots s_{n}\right), w_{0} \in \mathrm{~W}$. The number of Schubert varieties in $\mathrm{P} \backslash \mathrm{G}=\left[\mathrm{W}: \mathrm{W}_{\mathrm{P}}\right]=n+1$.
4. The family of closed Bruhat cells $\left\{\mathrm{X}\left(w_{i}\right)\right\}$. - Define two sequences $\left\{\tau_{i}\right\}$ and $\left\{w_{i}\right\}$ of elements in W as follows,

$$
\begin{array}{lll}
\left\{\tau_{i}\right\}: & \tau_{0}=\mathrm{Id} \text { and } \tau_{i}=s_{n} \ldots s_{n-i+1}, & \\
\left\{w_{i}\right\}: & w_{i}=w_{0} \tau_{i}=w_{0}^{\prime} s_{1} \ldots s_{n-i}, & \\
w_{i} \leqq n ; \\
\end{array}
$$

[^2]Now we have the following

## Proposition A. 2.

$$
\begin{equation*}
\mathrm{G}=\mathrm{X}\left(w_{0}\right) \supset \mathrm{X}\left(w_{1}\right) \supset \ldots \supset \mathrm{X}\left(w_{n}\right)=\mathrm{P} \tag{i}
\end{equation*}
$$

(ii) Each $\mathrm{X}\left(w_{i}\right)$ is of codimension 1 in $\mathrm{X}\left(w_{i-1}\right)$.
(iii) $\mathrm{X}\left(w_{i}\right)$ are precisely the inverse images (under the natural morphism $\mathrm{G} \rightarrow \mathrm{P} \backslash \mathrm{G}$ ) of the Schubert varieties in $\mathrm{P} \backslash \mathrm{G}$.
Proof. - Since each $w_{i}$ is a segment of $w_{0}$ and the expression for $w_{0}$ is reduced, the expression for $w_{i}$ is also reduced. Since $w_{i+1}=w_{i} s_{n-i}$, (i) and (ii) are immediate from Proposition 1.7 and the fact that codimension of $\mathrm{X}(w)$ in $\mathrm{X}(u)$ [with $\mathrm{X}(w) \subseteq \mathrm{X}(u)$ ] is $l(u)-l(w)$ for all $w$ and $u \in \mathrm{~W}$ (cf. Remark 1.10). Since $w_{0}^{\prime}$ is the element of largest length in $\mathrm{W}_{\mathrm{P}}$, we have $l\left(s_{j} w_{0}^{\prime}\right)<l\left(w_{0}^{\prime}\right)$ for all $j \geqq 2$, and hence $l\left(s_{j} w_{i}\right)<l\left(w_{i}\right)$ for all $i$ and $j \neq 1$. But then by Proposition 1.4, $\mathrm{X}\left(w_{i}\right)$ is stable for multiplication on the left by all the (minimal) parabolic subgroups $\mathrm{P}_{\alpha_{j}}, j \geqq 2$ and hence also by P . Thus each $\mathrm{X}\left(w_{i}\right)$ is the inverse image of a Schubert variety in $\mathrm{P} \backslash \mathrm{G}$. But the number of Schubert varieties in $\mathrm{P} \backslash \mathrm{G}$ is $\left[\mathrm{W}: \mathrm{W}_{\mathrm{P}}\right]=n+1$ and hence (iii) follows.

## Remark A. 3.

(i) From the Bruhat decomposition of G (relative to P ) and the above proposition, it follows that

$$
\mathrm{X}\left(w_{i}\right)=\mathrm{P} w_{i} \mathrm{~B} \cup \mathrm{X}\left(w_{i+1}\right), \quad 0 \leqq i \leqq n-1
$$

the union being set-theoretic and disjoint.
(ii) $\mathrm{X}\left(w_{i}\right)$ is stable for multiplication on the right by the (minimal) parabolic subgroup $\mathrm{P}_{\alpha_{n-i}}$. This is immediate from Proposition 1.4, because $w_{i+1}=w_{i} s_{n-i}$ and $l\left(w_{i+1}\right)=l\left(w_{i}\right)-1$.

Proposition A.4. - We have (set-theoretically) :

$$
\mathrm{X}\left(w_{i}\right) \cap \mathrm{X}\left(w_{1}\right) \tau_{i}=\mathrm{X}\left(w_{i+1}\right), \quad 0 \leqq i \leqq n-1,
$$

where $\mathrm{X}\left(w_{1}\right) \tau_{i}$ denotes the translate of $\mathrm{X}\left(w_{1}\right)$ by an element in $\mathrm{N}(\mathrm{T})$ whose residue class $\bmod \mathrm{T}$ is $\tau_{i}\left(\tau_{i}=w_{0} w_{i}\right)$.

Proof. - Observe the following simple facts.
(a) $\mathrm{X}\left(w_{i}\right) \notin \mathrm{X}\left(w_{1}\right) \tau_{i}$ (consequently the intersection is proper). For otherwise, we have $\mathrm{X}\left(w_{i}\right) \subseteq \mathrm{X}\left(w_{1}\right) \tau_{i}$ i. e., $\mathrm{X}\left(w_{i}\right) \tau_{i}^{-1} \subseteq \mathrm{X}\left(w_{1}\right)$ which gives in particular that $w_{0}=w_{i} \tau_{i}^{-1} \in \mathrm{X}\left(w_{1}\right)$ and hence $\mathrm{G}=\mathrm{X}\left(w_{0}\right) \subseteq \mathrm{X}\left(w_{1}\right)$ which is a contradiction. Now it follows that $(b) Z_{i}=\mathrm{X}\left(w_{i}\right) \cap \mathrm{X}\left(w_{1}\right) \tau_{i}$ is of pure codimension 1 in $\mathrm{X}\left(w_{i}\right)$ [because $\mathrm{X}\left(w_{1}\right)$ is irreductible and of codimension 1 in G$]$. (c) $\mathrm{P} w_{i} \mathrm{~B} \cap \mathrm{X}\left(w_{1}\right) \tau_{i}=\varnothing$. To see this, first note that $\mathrm{B} w_{i} \mathrm{~B} \cap \mathrm{X}\left(w_{1}\right) \tau_{i}=\varnothing$. Otherwise, we have $x \tau_{i}^{-1} \in \mathrm{X}\left(w_{1}\right)$ for some $x \in \mathrm{~B} w_{i} \mathrm{~B}$. By Proposition 1.3, we can write $x=b_{1} w_{i} b_{2}$ with $b_{1} \in \mathrm{~B}$ and a
unique $b_{2} \in \mathrm{~B}^{u} \cap w_{i}^{-1} \tilde{\mathrm{~B}}^{u} w_{i}$. Write $b_{2}=w_{i}^{-1} c w_{i}$ with $c \in \tilde{\mathrm{~B}}^{u}$ and also write $c=w_{0} d w_{0}$ for some $d \in \mathbf{B}^{u}$ (since $\tilde{\mathbf{B}}=w_{0} \mathbf{B} w_{0}$ ). Thus we have

$$
x \tau_{i}^{-1}=b_{1} w_{i} w_{i}^{-1} w_{0} d w_{0} w_{i} w_{i}^{-1} w_{0}=b_{1} w_{0} d \in \mathrm{X}\left(w_{1}\right)
$$

and hence $w_{0} \in \mathrm{X}\left(w_{1}\right)$, a contradiction.
Now suppose that $\mathrm{P} w_{i} \mathrm{~B} \cap \mathrm{X}\left(w_{1}\right) \tau_{i} \neq \varnothing$. Then some $x=p w_{i} b \in \mathbf{X}\left(w_{1}\right) \tau_{i}$. Since $\mathrm{X}\left(w_{1}\right) \tau_{i}$ is P -stable on the left, we get that $p^{-1} x=w_{i} b \in \mathbf{X}\left(w_{1}\right) \tau_{i}$ which means $\mathrm{B} w_{i} \mathrm{~B} \cap \mathrm{X}\left(w_{1}\right) \tau_{i} \neq \varnothing$, a contradiction.

Now the proof of the proposition is immediate in view of Proposition A.2, Remark A. 3 and the facts (b) and (c) above.

Proposition A.5. - Let $\chi_{i}=\tau_{i}^{-1}\left(\tilde{\omega}_{n}\right), 0 \leqq i \leqq n-1$. For each $i$, there exists an element $f_{i} \in \mathrm{H}^{0}\left(\mathrm{X}\left(w_{i}\right)_{r},\left.\mathrm{~L}\left(\chi_{i}\right)\right|_{\left.\mathbf{X}\left(w_{i}\right)_{r}\right)}\right)$ such that (set-theoretically) the set of zeros of $f_{i}$ in $\mathrm{X}\left(w_{i}\right)_{r}$ is $\mathrm{X}\left(w_{i+1}\right)_{r}$. (A more precise description of the $f_{i}$ 's is available in the proof below.)

Proof. - Since $w_{1}=w_{0} s_{n}=s_{1} w_{0}$, we know by Remark 1.11 that there exists a section $f \in \mathrm{H}^{0}\left(\mathrm{G} / \mathrm{B}, \mathrm{L}\left(\tilde{\omega}_{n}\right)\right)$ such that $\mathrm{X}\left(w_{1}\right)$ is the set of zeros of the morphism $f: \mathrm{G} \rightarrow k$ and $f$ satisfies the double invariance property, namely,

$$
f\left(b g b^{\prime}\right)=\tilde{\omega}_{1}\left(b^{-1}\right) f(g) \tilde{\omega}_{n}\left(b^{\prime}\right)
$$

for all $b, b^{\prime} \in \mathrm{B}$ and $g \in \mathrm{G}$.
For a fixed $h \in \mathrm{G}$, consider the function $f_{h}: \mathrm{G} \rightarrow k$ defined by $f_{h}(g)=f(g h)$ for all $g \in \mathrm{G}$. [Observe that $f_{h} \in \mathrm{H}^{0}\left(\mathrm{~B} \backslash \mathrm{G}, \mathrm{L}\left(\tilde{\omega}_{1}\right)\right)$ but need not define a section of any line bundle on G/B.] We have

$$
f_{h}(g)=0 \Leftrightarrow g h \in X\left(w_{1}\right) \Leftrightarrow g \in X\left(w_{1}\right) h^{-1}
$$

i. e., the set of zeros of $f_{h}$ is precisely $\mathrm{X}\left(w_{1}\right) h^{-1}$. Note that for $t \in \mathrm{~T}$, we have

$$
f_{h t}(g)=f(g h t)=f(g h) \tilde{\omega}_{n}(t)=f_{h}(g) \tilde{\omega}_{n}(t)
$$

i. e., the functions $f_{h}$ and $f_{h t}$ differ by multiplication by a non-zero scalar. Since this ambiguity of a non-zero scalar multiple does not change our future calculations, we write $f_{i}=f_{\tau_{i}-1}, 0 \leqq i<n$, and find that $f_{0}=f$ and the set of zeros of $f_{i}$ is $\mathrm{X}\left(w_{1}\right) \tau_{i}$. Now the result follows, in view of Proposition A.4, once we prove that $f_{i}$ defines a section of the line bundle $\left.\mathrm{L}\left(\chi_{i}\right)\right|_{\mathrm{X}\left(w_{i}\right)_{r}}$, i. e. it suffices to show that

$$
f_{i}(g b)=f_{i}(g) \chi_{i}(b)
$$

for all $g \in \mathbf{X}\left(w_{i}\right)$ and $b \in \mathrm{~B}$.
Recall that $\chi_{i}=\tau_{i}^{-1}\left(\tilde{\omega}_{n}\right): \mathrm{T} \rightarrow k^{*}$ is the character defined by $\chi_{i}(t)=\tilde{\omega}_{n}\left(\tau_{i} t \tau_{i}^{-1}\right)$ for $t \in \mathrm{~T}$. Let $b \in \mathrm{~B}$ and write $b=b^{u} . t$ for some $b^{u} \in \mathrm{~B}^{u}$ and $t \in \mathrm{~T}$. We have

$$
\begin{aligned}
f_{i}(g b) & =f\left(g b \cdot \tau_{i}^{-1}\right)=f\left(\left(g b^{u} \tau_{i}^{-1}\right)\left(\tau_{i} t \tau_{i}^{-1}\right)\right) \\
& =f\left(g b^{u} \tau_{i}^{-1}\right) \tilde{\omega}_{n}\left(\tau_{i} t \tau_{i}^{-1}\right)=f_{i}\left(g b^{u}\right) \chi_{i}(t)=f_{i}\left(g b^{u}\right) \chi_{i}(b)
\end{aligned}
$$

[^3]Thus it suffices to prove that $f_{i}\left(g b^{u}\right)=f_{i}(g)$ for $g \in \mathrm{X}\left(w_{i}\right)$ and $b^{u} \in \mathrm{~B}^{u}$. We see easily that it suffices to verify this for $g=w_{i}$, i. e. we have only to check that $f_{i}\left(w_{i} b^{u}\right)=f_{i}\left(w_{i}\right)$ for all $b^{u} \in \mathrm{~B}^{u}$. For this, as in (c) of Proposition A.4, write $w_{i} b^{u}=b_{1} w_{i} b_{2}$ with $b_{2}=w_{i}^{-1} w_{0} d w_{0} w_{i}$ where $b_{1} \in \mathrm{~B}$ and $d \in \mathrm{~B}^{u}$, etc. We can assume that $b_{1} \in \mathrm{~B}^{u}$ as T fixes elements of $W$. We have

$$
\begin{aligned}
f_{i}\left(w_{i} b^{u}\right) & =f_{i}\left(b_{1} w_{i} b_{2}\right)=f_{i}\left(b_{1} w_{i} w_{i}^{-1} w_{0} d w_{0} w_{i}\right)=f\left(b_{1} w_{0} d w_{0} w_{i} \tau_{i}^{-1}\right) \\
& =f\left(b_{1} w_{0} d\right)\left(\text { since } \tau_{i}=w_{0} w_{i}\right)=\tilde{\omega}_{1}\left(b_{1}^{-1}\right) f\left(w_{0}\right) \tilde{\omega}_{n}(d) \\
& =f\left(w_{0}\right)\left(\text { since } b_{1}, d \in \mathrm{~B}^{u}\right)=f\left(w_{i} w_{i}^{-1} w_{0}\right)=f\left(w_{i} \tau_{i}^{-1}\right) \\
& =f_{i}\left(w_{i}\right)
\end{aligned}
$$

as required.
5. The family of characters $\left\{\chi_{i}\right\}$.

Proposition A.6. - We have $\chi_{0}=\tau_{0}^{-1}\left(\tilde{\omega}_{n}\right)=\tilde{\omega}_{n}$ and

$$
\chi_{i}=\tau_{i}^{-1}\left(\tilde{\omega}_{n}\right)=\tilde{\omega}_{n-i}-\tilde{\omega}_{n-i+1} \quad \text { for } \quad 1 \leqq i \leqq n-1
$$

Proof. - We prove this by increasing indiction on $i$. (Recall that $\alpha_{j}=\sum_{k=1}^{n} n_{j k} \tilde{\omega}_{k}$ where $n_{j k}$ are the Cartan numbers.) We have for $i=1, \tau_{1}=s_{n}$ and

$$
\begin{aligned}
s_{n}\left(\tilde{\omega}_{n}\right) & =\tilde{\omega}_{n}-\left(\tilde{\omega}_{n}, \alpha_{n}^{*}\right) \alpha_{n}=\tilde{\omega}_{n}-\alpha_{n} \\
& =\tilde{\omega}_{n}-\left(-\tilde{\omega}_{n-1}+2 \tilde{\omega}_{n}\right)=\tilde{\omega}_{n-1}-\tilde{\omega}_{n} .
\end{aligned}
$$

Assume the result proved for all $k<i$. Recall that $\tau_{i}=\tau_{i-1} s_{n-i+1}$ and hence

$$
\begin{aligned}
\tau_{i}^{-1}\left(\tilde{\omega}_{n}\right) & =s_{n-i+1}\left(\tau_{i-1}^{-1}\left(\tilde{\omega}_{n}\right)\right)=s_{n-i+1}\left(\tilde{\omega}_{n-i+1}-\tilde{\omega}_{n-i+2}\right) \quad \text { (by induction) } \\
& =\tilde{\omega}_{n-i+1}-\alpha_{n-i+1}-\tilde{\omega}_{n-i+2} \\
& =\tilde{\omega}_{n-i+1}-\left(-\tilde{\omega}_{n-i}+2 \tilde{\omega}_{n-i+1}-\tilde{\omega}_{n-i+2}\right)-\tilde{\omega}_{n-i+2} \\
& =\tilde{\omega}_{n-i}-\tilde{\omega}_{n-i+1}
\end{aligned}
$$

as required.
6. Structure of Schubert varieties in $\mathrm{P} \backslash \mathrm{G}$. - For the purpose of this section, we take $\mathrm{G}=\mathrm{SL}(n+1)$ and fix T and B as usual (i. e., the diagonal and upper triangular matrices). It is easy to see that $\mathrm{P}=\mathrm{P}_{\hat{\alpha}_{1}}$ is the subgroup of matrices of the form $\left(g_{i j}\right)$, $0 \leqq i, j \leqq n$, with $g_{i 0}=0$ for $i \geqq 1$, and its " semi-simple part" is the set of matrices of the form

$$
\left(\begin{array}{cccc}
1 & 0 & \ldots & 0 \\
0 & & & \\
\vdots & & \mathrm{X} & \\
0 & & &
\end{array}\right) \approx \operatorname{SL}(n)
$$

We identify $\mathbf{P} \backslash \mathrm{G}$ with the projective space $\mathbf{P}(\mathrm{V})$ where V is a vector space of dimension $n+1$, with coordinates $\left(x_{0}, \ldots, x_{n}\right)$. The action of $G$ on the right can be identified with the usual multiplication of matrices, namely,

$$
\left(x_{0}, \ldots, x_{n}\right)\left(g_{i j}\right)=\left(\ldots, \sum_{i=0}^{n} x_{i} g_{i j}, \ldots\right)
$$

It is clear that the linear subspaces of $\mathbf{P}(\mathrm{V})$ defined by $(0, *, \ldots, *), \ldots,(0, \ldots, 0, *)$ are B-stable i.e., the Schubert varieties in $\mathbf{P}(\mathrm{V})$ are obtained by taking

$$
x_{0}=0 ; \quad x_{0}=x_{1}=0 ; \quad \ldots ; \quad x_{0}=x_{1}=\ldots=x_{n-1}=0
$$

In particular (these are non-singular and) each is obtained from the previous one with the (scheme-theoretic) intersection of a hyper-plane in $\mathbf{P}(\mathrm{V})$.
7. The ideal sheaf of $\mathbf{X}\left(w_{i}\right)_{r}$ in $X\left(w_{i-1}\right)_{r}$.

Proposition A.7. - The sheaf of ideals defining $\mathrm{X}\left(w_{i}\right)_{r}$ in $\mathrm{X}\left(w_{i-1}\right)_{r}$ is precisely $\left.\mathrm{L}\left(-\chi_{i-1}\right)\right|_{\mathrm{X}\left(w_{i-1}\right)_{r}}$ (i.e., the equalities in Proposition A. 4 and $A .5$ are scheme-theoretic).

Proof. - Let M denote the tautological line bundle on the projective space $\mathbf{P}(\mathrm{V})=\mathrm{P} \backslash \mathrm{G}$ where V is a vector space of dimension $n+1$ with coordinates $\left(x_{0}, \ldots, x_{n}\right)$. By Proposition A. 2, we know that $\mathrm{Y}_{i}=\mathrm{X}_{\mathrm{P}}\left(w_{i}\right)_{l}, 0 \leqq i \leqq n$, are the Schubert varieties in $\mathrm{P} \backslash \mathrm{G}$. We have seen that $Y_{i}$ is scheme-theoretically the intersection of $Y_{i-1}$ and the hyper-plane whose equation is $x_{i-1}=0$ [i.e., the set of zeros of the section $\left.x_{i-1} \in H^{0}(P \backslash G, M)\right]$.

Recall that, if $\pi_{l}: B \backslash G \rightarrow P \backslash G$ is the natural morphism, we have $\pi_{l}^{*} M=L\left(\tilde{\omega}_{1}\right)$ and that

$$
\mathrm{H}^{0}(\mathrm{P} \backslash \mathrm{G}, \mathrm{M})=\mathrm{H}^{0}\left(\mathrm{~B} \backslash \mathrm{G}, \mathrm{~L}\left(\tilde{\omega}_{1}\right)\right)
$$

Hence, we see that the functions $f_{i}, 0 \leqq i<n$, as in Proposition A.5, are elements in $\mathrm{H}^{0}(\mathrm{P} \backslash \mathrm{G}, \mathrm{M})$ and have the property that $\mathrm{Y}_{i}$ is set-theoretically the intersection of $\mathrm{Y}_{i-1}$ and the set of zeros of $f_{i-1}$. Hence it follows that each $f_{i}$ is a non-zero scalar multiple of $x_{i}$, consequently, we get that $\mathrm{X}\left(w_{i}\right)_{l}\left[\right.$ resp. $\left.\mathrm{X}\left(w_{i}\right)\right]$ is scheme-theoretically, the intersection of $\mathbf{X}\left(w_{i-1}\right)_{l}\left[\operatorname{resp} . X\left(w_{i-1}\right)\right]$ and the set of zeros of the section

$$
f_{i-1} \in \mathrm{H}^{0}\left(\mathrm{~B} \backslash \mathrm{G}, \mathrm{~L}\left(\tilde{\omega}_{1}\right)\right)
$$

(resp. the function $f_{i-1}: \mathrm{G} \rightarrow k$ ) because the morphism $\mathrm{B} \backslash \mathrm{G} \rightarrow \mathrm{P} \backslash \mathrm{G}$ (resp. $\mathrm{G} \rightarrow \mathrm{P} \backslash \mathrm{G}$ ) is smooth. Since the morphism $G \rightarrow G / B$ is smoth, it follows that $X\left(w_{i}\right)_{r}$ is schemetheoretically the intersection of $\mathrm{X}\left(w_{i-1}\right)_{r}$ and the set of zeros of the section

$$
f_{i-1} \in \mathrm{H}^{0}\left(\mathrm{X}\left(w_{i-1}\right)_{r},\left.\mathrm{~L}\left(\chi_{i-1}\right)\right|_{\mathrm{X}\left(w_{i-1}\right)_{r}}\right)
$$

and hence the result.

## 8. Vanishing Theorem.

Theorem A.8. - For every line bundle $\mathrm{L}(\chi)$ on $\mathrm{G} / \mathrm{B}$ belonging to the dominant chamber [i. e., $\left(\chi, \alpha_{j}^{*}\right) \geqq 0$ for all $\left.j\right]$, we have

$$
\mathrm{H}^{p}\left(\mathrm{X}\left(w_{i}\right)_{r},\left.\mathrm{~L}(\chi)\right|_{\mathrm{X}\left(w_{i}\right)_{r}}\right)=0 \quad \text { for all } p>0
$$

$$
4^{\text {e }} \text { série - tome } 7 \text { - } 1974 \text { - No } 1
$$

and $i=0, \ldots, n$. In particular for $i=0$, we have

$$
\mathrm{H}^{p}(\mathrm{G} / \mathrm{B}, \mathrm{~L}(\chi))=0 \text { for all } p>0
$$

Proof. - Write $\mathrm{X}_{i}=\mathrm{X}\left(w_{i}\right)_{r}, 0 \leqq i \leqq n$. We prove the result by induction on $n=$ rank of $G$ as well as on the dimension of $X_{i}$. If $n=1, X_{1}$ is a point and $X_{0}=G / B \approx \mathbf{P}^{1}$ and so the result follows. Assume $n>1$ and the result true for the groups of type $\mathbf{A}_{m}$, $m<n$.
We have $\operatorname{dim} \mathrm{X}_{i} \geqq \operatorname{dim} \mathrm{X}_{n}$ for all $i$ and $\mathrm{X}_{n}=\mathrm{P} / \mathrm{B}$. We know that the semi-simple part of P is of type $\mathbf{A}_{n-1}$, and so the result is true for $\mathrm{X}_{n}$ by the induction hypothesis. Now assume the second induction hypothesis namely that the result is true for all $\mathrm{X}_{k}, k>i$. To prove the result for $\mathbf{X}_{i}$ - By Proposition A.7, the sheaf of ideals defining $X_{i+1}$ in $X_{i}$ is

$$
\left.\approx \mathrm{L}\left(-\chi_{i}\right)\right|_{\mathrm{x}_{i}}=\left.\mathrm{L}\left(\tilde{\omega}_{n-i+1}-\tilde{\omega}_{n-i}\right)\right|_{\mathrm{x}_{i}} .
$$

This gives the exact sequence

$$
\left.0 \rightarrow \mathrm{~L}\left(\tilde{\omega}_{n-i+1}-\tilde{\omega}_{n-i}\right)\right|_{\mathbf{x}_{i}} \rightarrow \mathcal{O}_{\mathbf{x}_{i}} \rightarrow \mathcal{O}_{\mathbf{x}_{i+1}} \rightarrow 0
$$

Tensoring by $\mathrm{L}(\chi)$, we get the exact sequence

$$
\left.\left.\left.0 \rightarrow \mathrm{~L}\left(\chi^{\prime}\right)\right|_{\mathrm{x}_{i}} \rightarrow \mathrm{~L}(\chi)\right|_{\mathrm{x}_{i} \rightarrow \mathrm{~L}} \mathrm{~L}(\chi)\right|_{\mathrm{x}_{i+1}} \rightarrow 0,
$$

where $\chi^{\prime}=\chi+\tilde{\omega}_{n-i+1}-\tilde{\omega}_{n-i}$.
This gives the cohomology exact sequence

$$
\rightarrow \mathrm{H}^{p}\left(\mathrm{X}_{i}, \mathrm{~L}\left(\chi^{\prime}\right)\right) \rightarrow \mathrm{H}^{p}\left(\mathrm{X}_{i}, \mathrm{~L}(\chi)\right) \rightarrow \mathrm{H}^{p}\left(\mathrm{X}_{i+1}, \mathrm{~L}(\chi)\right) \rightarrow
$$

By the second induction hypothesis, this sequence reduces to the exact sequences

$$
\mathrm{H}^{p}\left(\mathrm{X}_{i}, \mathrm{~L}\left(\chi^{\prime}\right)\right) \rightarrow \mathrm{H}^{p}\left(\mathrm{X}_{i}, \mathrm{~L}(\chi)\right) \rightarrow 0
$$

for all $p \geqq 1$.
Now we complete the proof of the theorem by increasing induction on the integer $\left(\chi, \alpha_{n-i}^{*}\right)$ i. e., the degree of $\mathrm{L}(\chi)$ with respect to the $\mathbf{P}^{1}$-fibration $\mathrm{G} / \mathrm{B} \rightarrow \mathrm{G} / \mathrm{P}_{\alpha_{n-i}}$. Note that we have

$$
\begin{equation*}
\left(\chi^{\prime}, \alpha_{n-i}^{*}\right)=\left(\chi, \alpha_{n-i}^{*}\right)-1 \geqq-1 \tag{i}
\end{equation*}
$$

and

$$
\begin{equation*}
\left(\chi^{\prime}, \alpha_{j}^{*}\right) \geqq\left(\chi, \alpha_{j}^{*}\right) \quad \text { for all } j \neq n-i . \tag{ii}
\end{equation*}
$$

Suppose $\left(\chi, \alpha_{n-i}^{*}\right)=0$. Then, since $\left(\chi^{\prime}, \alpha_{n-i}^{*}\right)=-1$, by Remark A. 3 (ii) and Corollary 1.15 , we have

$$
\mathrm{H}^{p}\left(\mathrm{X}_{i}, \mathrm{~L}\left(\chi^{\prime}\right)\right)=0 \text { for all } p \geqq 1
$$

In this case $(\star)$ implies the required result. Assume now $\left(\chi, \alpha_{n-i}^{*}\right) \geqq 1$ and the induction hypothesis [that for all $\chi^{\prime \prime} \geqq 0$ such that $\left(\chi^{\prime \prime}, \alpha_{n-i}^{*}\right)<\left(\chi, \alpha_{n-i}^{*}\right)$, we have $\mathrm{H}^{p}\left(\mathrm{X}_{i}, \mathrm{~L}\left(\chi^{\prime \prime}\right)\right)=0$
for all $p \geqq 1$ ]. But then in view of (i) and (ii) above we have $\chi^{\prime} \geqq 0$ and so by the induction hypothesis we find that $\mathrm{H}^{p}\left(\mathrm{X}_{i}, \mathrm{~L}\left(\chi^{\prime}\right)=0\right)$ for all $p \geqq 1$ and hence $(\star)$ implies the required result.

This completes the proof of the theorem.

## B. Type $\mathbf{B}_{n}(n \geqq 2)$

1. Numerical data. - Recall the following facts for a group $G$ of type $B_{n}$.

Dynkin diagram :

The Cartan numbers

$$
n_{i j}=\left(\alpha_{i}, \alpha_{j}^{*}\right)=2\left(\alpha_{i}, \alpha_{j}\right) /\left(\alpha_{j}, \alpha_{j}\right)
$$

are given by

$$
n_{i j}=\left\{\begin{aligned}
2 & \text { if } \quad i=j \\
-1 & \text { if } \quad i=j \pm 1 \text { and } i, j \leqq n-1 \\
-2 & \text { if }(i, j)=(n-1, n), \\
-1 & \text { if }(i, j)=(n, n-1) \\
0 & \text { otherwise. }
\end{aligned}\right.
$$

The number of roots $=2 n^{2}$.
The order of the Weyl group $\mathrm{W}\left(=\mathrm{W}\left(\mathrm{B}_{n}\right)\right)$ of $\mathrm{G}=2^{n} \cdot n$ !
2. A REDUCED EXPRESSION FOR $w_{0}$.

Proposition B.1. - A reduced expression for the element $w_{0} \in \mathrm{~W}$ (of largest lenght) is given by

$$
w_{0}=s_{n}\left(s_{n-1} s_{n} s_{n-1}\right) \ldots\left(s_{i} \ldots s_{n} \ldots s_{i}\right) \ldots\left(s_{1} \ldots s_{n} \ldots s_{1}\right)
$$

Proof. - This is similar to the proof of Proposition A.1. In this case we define the sequences $\left\{v_{i}\right\}$ and $\left\{u_{i}\right\}$ as follows:

$$
\begin{array}{llll}
\left\{v_{i}\right\}: & v_{n}=s_{n}, & v_{i}=s_{i} v_{i+1} s_{i}, & 1 \leqq i<n \\
\left\{u_{i}\right\}: & u_{n}=v_{n}, & u_{i}=u_{i+1} v_{i}, & 1 \leqq i<n
\end{array}
$$

The following assertion for $u_{1}$ together with Proposition 1.1 (iii) proves the proposition.

## Assertion I.

$$
u_{i}\left(\alpha_{j}\right)=\left\{\begin{array}{cl}
-\alpha_{j} & \text { for } i \leqq j \leqq n \\
\left(\alpha_{i-1}+2 \alpha_{i}+\ldots+2 \alpha_{n}\right) & \text { for } j=i-1 \\
\alpha_{j} & \text { for } j \leqq i-2
\end{array}\right.
$$

(In particular $u_{1}=-$ Id.)
We prove this by decreasing induction on $i$ using the fact that $u_{i}=u_{i+1} v_{i}$ and the values of $v_{i}\left(\alpha_{j}\right)$ from the following

```
4e SÉRIE - tome 7 - 1974 - No 1
```

Assertion II. - We have

$$
v_{i}\left(\alpha_{j}\right)=\left\{\begin{array}{cl}
\alpha_{j} & \text { for } j \neq i-1 \text { and } i, \\
-\left(\alpha_{i}+2 \alpha_{i+1}+\ldots+2 \alpha_{n}\right) & \text { for } j=i, \\
\left(\alpha_{i-1}+2 \alpha_{i}+\ldots+2 \alpha_{n}\right) & \text { for } j=i-1
\end{array}\right.
$$

We prove this again by decreasing induction on $i$ noting that $v_{i}=s_{i} v_{i+1} s_{i}$.
3. The Parabolic subgroup $\mathrm{P}\left(=\mathrm{P}_{\hat{\alpha}_{1}}\right)$. - As before, it can be seen that the semisimple part of $P$ is of type $B_{n-1}$ (or $A_{1}$ if $n=2$ ) and its Dynkin diagram can be taken to be

In particular, the element $w_{0}^{\prime}$ in the Weyl group $\mathrm{W}_{\mathrm{P}}\left(=\mathrm{W}\left(\mathrm{B}_{n-1}\right)\right)$ of P is given by

$$
w_{0}^{\prime}=s_{n}\left(s_{n-1} s_{n} s_{n-1}\right) \ldots\left(s_{i} \ldots s_{n} \ldots s_{i}\right) \ldots\left(s_{2} \ldots s_{n} \ldots s_{2}\right)
$$

Thus $w_{0}=w_{0}^{\prime}\left(s_{1} \ldots s_{n} \ldots s_{1}\right)$. The number of Schubert varieties in

$$
\mathrm{P} \backslash \mathrm{G}=\left[\mathrm{W}: \mathrm{W}_{\mathrm{P}}\right]=2 n
$$

4. The family of closed Bruhat cells $\left\{\mathrm{X}\left(w_{i}\right)\right\}$.-Define the sequences $\left\{r_{i}\right\},\left\{\tau_{i}\right\}$ and $\left\{w_{i}\right\}$ of elements in W as follows :

$$
\begin{array}{ll}
\left\{r_{i}\right\}: & r_{0}=\mathrm{Id}, \quad r_{1}=s_{1}, \ldots, r_{n}=s_{n}, \\
& r_{n+1}=s_{n-1}, \ldots, r_{n+i}=s_{n-i}, \ldots, r_{2 n-1}=s_{1} \\
\left\{\tau_{i}\right\}: & \tau_{0}=\mathrm{Id}, \quad \tau_{i}=r_{2 n-1} \ldots r_{2 n-i}, \quad 1 \leqq i \leqq 2 n-1 \\
\left\{w_{i}\right\}: & w_{i}=w_{0} \tau_{i}=w_{0}^{\prime} r_{1} \ldots r_{2 n-1-i}, \quad 0 \leqq i \leqq 2 n-1 .
\end{array}
$$

Proposition B. 2 .

$$
\begin{equation*}
\mathrm{G}=\mathrm{X}\left(w_{0}\right) \supset \mathrm{X}\left(w_{1}\right) \supset \ldots \supset \mathrm{X}\left(w_{2 n-1}\right)=\mathrm{P} \tag{i}
\end{equation*}
$$

(ii) Each $\mathrm{X}\left(w_{i}\right)$ is of codimension 1 in $\mathrm{X}\left(w_{i-1}\right)$.
(iii) $\mathrm{X}\left(w_{i}\right)$ are the inverse images (under the natural morphism $\mathrm{G} \rightarrow \mathrm{P} \backslash \mathrm{G}$ ) of the Schubert varieties in $\mathrm{P} \backslash \mathrm{G}$.

Proof. - Similar to that of Proposition A.2.
Remark B.3. - We have

$$
\begin{equation*}
\mathrm{X}\left(w_{i}\right)=\mathrm{P} w_{i} \mathrm{~B} \cup \mathrm{X}\left(w_{i+1}\right), \quad 0 \leqq i \leqq 2 n-2 \tag{i}
\end{equation*}
$$

the union being the set-theoretic and disjoint.
(ii) $\mathrm{X}\left(w_{i}\right)$ is stable for multiplication on the right by the (minimal) parabolic subgroup $\mathrm{P}_{\alpha_{i+1}}$ if $0 \leqq i \leqq n-1$ or $\mathrm{P}_{\alpha_{n-j-1}}$ if $i=n+j, \quad 0 \leqq j \leqq n-2$.

Proof. - Similar to that of Remark A.3.

Proposition B.4. - We have (set-theoretically) :

$$
\mathrm{X}\left(w_{i}\right) \cap \mathrm{X}\left(w_{1}\right) \tau_{i}=\mathrm{X}\left(w_{i+1}\right), \quad 0 \leqq i \leqq 2 n-2
$$

(where $\tau_{i}=w_{0} w_{i}$ ),
Proof. - Similar to that of Proposition A.4.
Proposition B.5. - Let $\chi_{i}=\tau_{i}^{-1}\left(\tilde{\omega}_{1}\right), 0 \leqq i \leqq 2 n-2$. For each $i$, there exists an element $f_{i} \in \mathrm{H}^{0}\left(\mathrm{X}\left(w_{i}\right)_{r}, \mathrm{~L}\left(\chi_{i}\right){\mathrm{X}\left(w_{i}\right)}\right)$ such that (set-theoretically) the set of zeros of $f_{i}$ in $\mathrm{X}\left(w_{i}\right)_{r}$ is $\mathrm{X}\left(w_{i+1}\right)_{r}$. (A more precise description of the $f_{i}$ 's is available in the proof below).

Proof. - Since $w_{1}=w_{0} s_{1}=s_{1} w_{0}$, we know by Remark 1.11 that there exists a section $f \in \mathbf{H}^{0}\left(\mathrm{G} / \mathrm{B}, \mathrm{L}\left(\tilde{\omega}_{1}\right)\right)$ such that $\mathrm{X}\left(w_{1}\right)$ is the set of zeros of the morphism $f: \mathrm{G} \rightarrow k$ and $f$ satisfies the double invariance property, namely,

$$
f\left(b g b^{\prime}\right)=\tilde{\omega}_{1}\left(b^{-1}\right) f(g) \tilde{\omega}_{1}\left(b^{\prime}\right)
$$

for all $b, b^{\prime} \in \mathrm{B}$ and $g \in \mathrm{G}$. As in the proof of Proposition A.5, we define $f_{i}=f_{\tau_{i}^{-1}}$, $0 \leqq i<2 n-1$ and prove that the $f_{i}$ 's are the required ones. [In fact, in proving that $f_{i}$ defines a section of $\left.\mathrm{L}\left(\chi_{i}\right)\right|_{\mathrm{X}\left(w_{i}\right) r}$, we do not use the fact that $G$ is of type $\mathbf{A}_{n}$ or $\mathbf{B}_{n}$ ].
5. The family of characters $\left\{\chi_{i}\right\}$.

Proposition B.6. - The characters $\chi_{i}\left(=\tau_{i}^{-1}\left(\tilde{\omega}_{1}\right)\right), 0 \leqq i \leqq 2 n-2$, are given by $\chi_{0}=\tilde{\omega}_{1}$ and
(a)
(b)
(c)

$$
\chi_{i}=\tilde{\omega}_{i+1}-\tilde{\omega}_{i} \quad \text { for } \quad 1 \leqq i \leqq n-2
$$

$$
\chi_{n-1}=-\chi_{n}=2 \tilde{\omega}_{n}-\tilde{\omega}_{n-1}
$$

Proof. - Recall that $\tau_{0}=\mathrm{Id}$ and $\tau_{i}=r_{2 n-1} \ldots r_{2 n-i}$ for $1 \leqq i \leqq 2 n-1$ (see the previous section for the notation), i.e. we have

$$
\tau_{i}=s_{1} \ldots s_{i}=\tau_{i-1} s_{i} \quad \text { for } \quad 1 \leqq i \leqq n
$$

and

$$
\tau_{n+j}=\tau_{n+j-1} s_{n-j}, \quad 1 \leqq j \leqq n-1
$$

Proof of $(a)$. - We proceed by increasing induction on $i$. For $i=1$, we have $\tau_{1}=s_{1}$ and

$$
\begin{aligned}
s_{1}\left(\tilde{\omega}_{1}\right) & =\tilde{\omega}_{1}-\left(\tilde{\omega}_{1}-\alpha_{1}^{*}\right) \alpha_{1}=\tilde{\omega}_{1}-\alpha_{1} \\
& =\tilde{\omega}_{1}-\left(\sum_{j=1}^{n} n_{1 j} \tilde{\omega}_{j}\right)=\tilde{\omega}_{1}-\left(2 \tilde{\omega}_{1}-\tilde{\omega}_{2}\right)=\tilde{\omega}_{2}-\tilde{\omega}_{1}
\end{aligned}
$$

as required. Assume the result true for all $k<i$. Now

$$
\begin{aligned}
\chi_{i} & =\tau_{i}^{-1}\left(\tilde{\omega}_{1}\right)=s_{i} \tau_{i-1}^{-1}\left(\tilde{\omega}_{1}\right)=s_{i}\left(\tilde{\omega}_{i}-\tilde{\omega}_{i-1}\right)=\tilde{\omega}_{i}-\tilde{\omega}_{i-1}-\alpha_{i} \\
& =\tilde{\omega}_{i}-\tilde{\omega}_{i-1}-\left(\sum_{j=1}^{n} n_{i j} \tilde{\omega}_{j}\right)=\tilde{\omega}_{i}-\tilde{\omega}_{i-1}-\left(-\tilde{\omega}_{i-1}+2 \tilde{\omega}_{i}-\tilde{\omega}_{i+1}\right) \\
& =\tilde{\omega}_{i+1}-\tilde{\omega}_{i} \text { as required. }
\end{aligned}
$$

```
4e SÉrie - tome 7 - 1974 - No 1
```

Proof of (b). - We have

$$
\tau_{n-1}=\tau_{n-2} s_{n-1} \quad \text { and } \quad \tau_{n}=\tau_{n-1} s_{n}
$$

By (a), we have

$$
\chi_{n-2}=\tilde{\omega}_{n-1}-\tilde{\omega}_{n-2}
$$

Now

$$
\chi_{n-1}=s_{n-1}\left(\chi_{n-2}\right)=\chi_{n-2}-\left(\chi_{n-2}, \alpha_{n-1}^{*}\right) \alpha_{n-1}=\tilde{\omega}_{n-1}-\tilde{\omega}_{n-2}-\alpha_{n-1}
$$

But

$$
\alpha_{n-1}=\sum_{j=1}^{n} n_{n-1 j} \tilde{\omega}_{j}=-\tilde{\omega}_{n-2}+2 \tilde{\omega}_{n-1}-2 \tilde{\omega}_{n}
$$

and hence

$$
\chi_{n-1}=2 \tilde{\omega}_{n}-\tilde{\omega}_{n-1}\left(=\alpha_{n}\right)
$$

as required. Further, we have

$$
\chi_{n}=s_{n}\left(\chi_{n-1}\right)=s_{n}\left(\alpha_{n}\right)=-\alpha_{n}=-\chi_{n-1}
$$

and hence the result.
Proof of $(c)$. - We proceed by increasing induction on $j$. Recall that

$$
\tau_{n+j}=\tau_{n+j-1} s_{n-j}, \quad 1 \leqq j \leqq n-2
$$

For $j=1$, we have

$$
\begin{aligned}
\chi_{n+1} & =s_{n-1}\left(\chi_{n}\right)=\tilde{\omega}_{n-1}-2 \tilde{\omega}_{n}-\alpha_{n-1} \quad[\operatorname{by}(b)] \\
& =\tilde{\omega}_{n-2}-\tilde{\omega}_{n-1} \quad\left(\text { since } \alpha_{n-1}=-\tilde{\omega}_{n-2}+2 \tilde{\omega}_{n-1}-2 \tilde{\omega}_{n}\right)
\end{aligned}
$$

as required. Now the result follows with the obvious formal step.
This completes the proof of the proposition.
6. Structure of Schubert varieties in P\G. - Recall (cf. § 1,8 above) that for the purpose of this section we can take any connected semi-simple group of type $\mathbf{B}_{n}$ (simply connected or not). For instance, we take $\mathrm{G}=\mathrm{SO}(2 n+1)$, called the (odd) Orthogonal group in $2 n+1$ variables (cf. [2], [7], [23] and [25]). Recall that SO (2n+1) is realised as a subgroup of GL $(2 n+1)$ as follows :

Let V be a vector space of rank $(2 n+1)$ over the ground field $k$. Let us choose a basis $e_{1}, \ldots, e_{n}, e_{n+1}, \ldots, e_{2 n+1}$ of V . Let us represent a point $v$ of V by

$$
v=\left(x_{1}, \ldots, x_{n}, z, y_{1}, \ldots, y_{n}\right)
$$

with respect to this basis. Let $\mathrm{Q}\left(\mathrm{Q}=\mathrm{Q}_{n}\right)$ be the quadratic form

$$
\mathrm{Q}(v)=z^{2}+\left(x_{1} y_{n}+x_{2} y_{n-1}+\ldots+x_{n} y_{1}\right)
$$

with respect to this basis. Then $\mathrm{SO}(2 n+1)$ is defined as the subgroup of $\mathrm{SL}(2 n+1)$ which leaves Q invariant, i.e.,

$$
\mathrm{SO}(2 n+1)=\{\mathrm{A} \in \mathrm{SL}(2 n+1) / \mathrm{Q}(\mathrm{~A} v)=\mathrm{Q}(v) \text { for all } v \in \mathrm{~V}\}
$$

For this imbedding SO $(2 n+1) \subsetneq \mathrm{GL}(2 n+1)$, the subgroup T (resp. B) of $\mathrm{SO}(2 n+1)$ consisting of the diagonal (resp. upper triangular) matrices is a maximal torus (resp. Borel subgroup). Fixing these, it is easy to check that $\mathrm{P}=\mathrm{P}_{\hat{\alpha}_{1}}$ is precisely the subgroup of $\mathrm{SO}(2 n+1)$ consisting of the set of matrices of the form

$$
\left(\begin{array}{ccccc}
* & * & \ldots & * & * \\
0 & * & \ldots & * & * \\
\cdot & \cdot & & * & * \\
\cdot & * & & * & 0
\end{array}\right)
$$

and its " semi-simple part" is the set of matrices of the form

$$
\left(\begin{array}{cccc}
1 & 0 & \ldots & 0 \\
0 & \boxed{X} & 0 \\
\vdots & & \vdots \\
0 & 0 & \ldots & 1
\end{array}\right) \approx \operatorname{SO}(2 n-1)
$$

Let $\mathrm{P}^{\prime}$ be the (maximal) parabolic subgroup of GL $(2 n+1)$ consisting of the set of matrices of the form

$$
\left(\begin{array}{llll}
* & * & \cdots & * \\
0 & * & \ldots & * \\
0 & \cdot & \cdots & *
\end{array}\right)
$$

It is seen easily that $\mathrm{P}=\mathrm{SO}(2 n+1) \cap \mathrm{P}^{\prime}$ (as group schemes).
As usual identifying $P^{\prime} \backslash G L(2 n+1)$ canonically with $P(V)$, we see easily that the canonical closed immersion $P \backslash G G P^{\prime} \backslash G L(2 n+1)=P(V)$ identifies $P \backslash G$ with the quadraic $\mathrm{Q}=0$.

Notice that the points on $\mathrm{P} \backslash \mathrm{G}$ fixed by the maximal torus T are precisely the points $(0, \ldots, 0,1,0, \ldots, 0), 1$ at the $i$-th place, $i \neq n+1$. Hence it is easy to see that the Schubert varieties in $\mathrm{P} \backslash \mathrm{G}$ are $\left(\mathrm{Y}_{i}\right)_{\text {red }}$, where

$$
\mathrm{Y}_{i}=\mathrm{P} \backslash \mathrm{G} \cap \mathbf{P}^{2 n-i}, \quad i=0,1, \ldots, n, \quad n+2, \ldots, 2 n
$$

(the intersection being scheme-theoretic) where

$$
\mathbf{P}^{2 n-i}=\{(0, \ldots, 0, \stackrel{i+1}{*}, *, \ldots, *)\}, \quad i=0,1, \ldots, n, \quad n+2, \ldots, 2 n
$$

are (all but one) Schubert varieties in $\mathbf{P}$ (V). In other words, we have

$$
\begin{aligned}
& \mathrm{Y}_{0}=\left\{\mathrm{Q}_{n}=x_{1} y_{n}+\ldots+x_{n} y_{1}+z^{2}=0 \text { in } \mathbf{P}=\mathbf{P}(\mathrm{V})\right\}, \\
& \mathrm{Y}_{1}=\left\{\mathrm{Q}_{n-1}=x_{2} y_{n-1}+\ldots+x_{n} y_{1}+z^{2}=0 \text { and } x_{1}=0 \text { in } \mathbf{P}\right\}, \\
& \vdots \\
& \mathrm{Y}_{i}=\left\{\mathrm{Q}_{n-i}=x_{i+1} y_{n-i}+\ldots+x_{n} y_{1}+z^{2}=0 \text { and } x_{1}=\ldots=x_{i}=0 \text { in } \mathbf{P}\right\}, \\
& \vdots \\
& \mathrm{Y}_{n-1}=\left\{\mathrm{Q}_{1}=x_{n} y_{1}+z^{2}=0 \text { and } x_{1}=\ldots=x_{n-1}=0 \text { in } \mathbf{P}\right\}, \\
& 4^{\mathrm{e}} \text { SÉRIE }- \text { томе } 7-1974-\mathrm{N}^{\mathrm{o}} 1
\end{aligned}
$$

$$
\begin{aligned}
\mathbf{Y}_{n} & =\left\{\mathbf{Q}_{0}=z^{2}=0 \text { and } x_{1}=\ldots=x_{n}=0 \text { in } \mathbf{P}\right\}, \\
\mathbf{Y}_{n+2} & =\left\{x_{1}=\ldots=x_{n}=z=y_{1}=0 \text { in } \mathbf{P}\right\}, \\
\vdots & \mathbf{Y}_{n+i}
\end{aligned}=\left\{x_{1}=\ldots=x_{n}=z=y_{1}=\ldots=y_{i-1}=0 \text { in } \mathbf{P}\right\}, ~ 子 \begin{aligned}
\vdots & \\
\mathbf{Y}_{2 n} & =\left\{x_{1}=\ldots=x_{n}=z=y_{1}=\ldots=y_{n-1}=0 \text { in } \mathbf{P}\right\} . \\
& =\text { the point }\{(0, \ldots, 0,1)\} .
\end{aligned}
$$

Thus we find that
(i) $\mathrm{Y}_{0}$ and $\mathrm{Y}_{n+i}, 2 \leqq i \leqq n$ are non-singular.
(ii) $\mathrm{Y}_{i}, 1 \leqq i \leqq n-1$, are (generalised) cones in $\mathbf{P}$ over the quadrics $\mathrm{Q}_{n-i}$ which lie in the lower dimensional projective spaces $\mathbf{P}^{2 n-2 i}$ with coordinates

$$
\left(x_{i+1}, \ldots, x_{n}, z, y_{1}, \ldots, y_{n-i}\right)
$$

In particular, the $Y_{i}$ 's are Cohen-Macaulay (being locally complete intersections). Further, it is easy to see that the singular set of $\mathrm{Y}_{i}$ is $\mathrm{Y}_{2 n-i+1}$ for $1 \leqq i \leqq n-1$, in particular non-singular in codimension 1 and hence normal.
(iii) $\mathrm{Y}_{n}$ is not reduced and $\left(\mathrm{Y}_{n}\right)_{\text {red }}$ is the projective space $\mathbf{P}^{n-1}$ with coordinates $\left(0, \ldots, 0, \mathrm{y}_{1}, \ldots, y_{n}\right)$ in $\mathbf{P}$.
$7(a)$. The ideal sheaf of $X\left(w_{i}\right)_{r}$ in $X\left(w_{i-1}\right)_{r}(i \neq n)$.
Proposition B.7. - The sheaf of ideals defining $\mathrm{X}\left(w_{i}\right)_{r}$ in $\mathrm{X}\left(w_{i-1}\right)_{r}$ is precisely $\left.\mathrm{L}\left(-\chi_{i-1}\right)\right|_{\mathrm{X}\left(w_{i-1}\right)_{r}}$ for $i \neq n$. i.e., the equalities in Propositions B. 4 and B. 5 are schemetheoretic for $i \neq n$.

Proof. - As in Proposition A. 7, this follows easily from the explicit description of the scheme-theoretic Schubert varieties in the quadric $P \backslash G$ and the smoothness of the morphisms $G \rightarrow P \backslash G$ and $G \rightarrow G / B$, etc.

Remark B.8. - We know that the closed Bruhat cells $\mathrm{X}\left(w_{0}\right), \ldots, \mathrm{X}\left(w_{n}\right), \ldots, \mathrm{X}\left(w_{2 n-1}\right)$ in G are the inverse images of $\mathrm{Y}_{0}, \ldots,\left(\mathrm{Y}_{n}\right)_{\mathrm{red}}, \ldots, \mathrm{Y}_{2 n}$ in $\mathrm{P} \backslash \mathrm{G}$. It follows therefore that $\mathrm{X}\left(w_{i}\right), i \neq n$, are reduced (in fact normal), etc. Further, it is easily seen that $\mathrm{X}\left(w_{n}\right)$ [resp. $\mathrm{X}\left(w_{n}\right)_{r}$ ] is not a Cartier divisor in $\mathrm{X}\left(w_{n-1}\right)$ [resp. $\mathrm{X}\left(w_{n-1}\right)_{r}$ ]. However, we see that $2 \mathrm{X}\left(w_{n}\right)$ [resp. $2 \mathrm{X}\left(w_{n}\right)_{r}$ ] is a Cartier divisor in $\mathrm{X}\left(w_{n-1}\right)$ [resp. $\mathrm{X}\left(w_{n-1}\right)_{r}$ ].

7 (b). The ideal sheaf of $X\left(w_{n}\right)_{r}$ in $X\left(w_{n-1}\right)_{r}$. - Let $Z$ (resp. $Z_{r}$, resp. $Z_{l}$ ) denote the subscheme of $\mathrm{X}\left(w_{n-1}\right)$ [resp. $\mathrm{X}\left(w_{n-1}\right)_{r}$, resp. $\mathrm{Y}_{n-1}$ ] whose ideal sheaf is generated by the function $f_{n-1}$ [resp. the section $f_{n-1}$ of $\left.\mathrm{L}\left(\chi_{n-1}\right)\right|_{\mathrm{X}\left(w_{n-1}\right)_{r}}$, resp. the equation $x_{n}=0$ ], $f_{n-1}$ as in Proposition B. 5.

Let $\mathrm{K}_{r}$ be the $\mathcal{O}_{\mathrm{Z}_{r}}$-module defined by the exact sequence

$$
0 \rightarrow \mathrm{~K}_{r} \rightarrow \mathcal{O}_{\mathrm{Z}_{r}} \rightarrow \mathcal{O}_{\left(\mathrm{Z}_{r}\right) \mathrm{red}} \rightarrow 0
$$

ANNALES SCIENTIFIQUES DE L'ÉCOLE NORMALE SUPÉRIEURE
[ $\left.\mathrm{X}\left(w_{n}\right)_{r}=\left(\mathrm{Z}_{r}\right)_{\text {red }}\right]$. It will be easily seen that $\mathrm{K}_{r}^{2}=0$ so that it can be canonically considered as an $\mathcal{O}_{\mathbf{X}\left(w_{n}\right) r}$-module. The problem is to compute $\mathrm{K}_{r}$. For this purpose, we consider $\mathrm{K}_{l}$, defined by the exact sequence

$$
0 \rightarrow \mathrm{~K}_{l} \rightarrow \mathcal{O}_{\mathrm{Z}_{1}} \rightarrow \mathcal{O}_{\left(\mathrm{Z}_{1}\right) \text { red }} \rightarrow 0 .
$$

From the explicit nature of cycles in $\mathrm{P} \backslash \mathrm{G}$, it is easy to compute $\mathrm{K}_{l}$. It requires some argument to compute $\mathrm{K}_{r}$ from knowing $\mathrm{K}_{l}$ and this is essentially achieved by Lemma B. 10, below.
Let $\pi_{r}: \mathrm{G} \rightarrow \mathrm{G} / \mathrm{B}$ (resp. $\pi_{l}: \mathrm{G} \rightarrow \mathrm{P} \mid \mathrm{G}$ ) be the canonical morphism. It is clear that

$$
\mathrm{Z}=\pi_{r}^{-1}\left(\mathrm{Z}_{r}\right)=\pi_{l}^{-1}\left(\mathrm{Z}_{l}\right)
$$

as schemes and that $\mathrm{Z}_{\text {red }}=\mathrm{X}\left(w_{n}\right)$. Similary we find that $\left(\mathrm{Z}_{r}\right)_{\text {red }}=\mathrm{X}\left(w_{n}\right)_{r}$ and $\mathrm{Z}_{l}=\mathrm{Y}_{n}$. We denote by the same letter $\mathbf{Z}$ the Cartier divisor on $\mathbf{X}\left(w_{n-1}\right)$ defined by the ideal sheaf of $Z$. Let $J=\mathcal{O}_{X\left(w_{n-1}\right)}(-Z)$. Notice that J can also be described as the sheaf of germs of regular functions on the normal variety $\mathrm{X}\left(w_{n-1}\right)$ vanishing up to order $\geqq 2$ on the codimension one subvariety $\mathbf{X}\left(w_{n}\right)$ of $\mathrm{X}\left(w_{n-1}\right)$. We define similarly the $\mathcal{O}_{\mathbf{X}\left(w_{n-1}\right) r}{ }^{-}$ module $\mathrm{J}_{r}$ and the $\mathcal{O}_{\left(\mathbf{Y}_{n}\right) \mathrm{rec}}$-module $\mathbf{J}_{l}$.

Denote by I the sheaf of ideals defining $\mathrm{X}\left(w_{n}\right)$ in $\mathrm{X}\left(w_{n-1}\right)$. Similarly, define $\mathrm{I}_{r}$ and $\mathrm{I}_{l}$. It is clear that $\pi_{r}^{*}\left(\mathbf{I}_{r}\right)=\mathrm{I}=\pi_{l}^{*}\left(\mathbf{I}_{l}\right)$ and also $\pi_{r}^{*}\left(\mathbf{J}_{r}\right)=\mathrm{J}=\pi_{l}^{*}\left(\mathbf{J}_{l}\right)$. We observe the following facts :
(a)

$$
\mathrm{I}^{2} \subset \mathrm{~J}\left(\mathrm{I}_{r}^{2} \subset \mathrm{~J}_{r} \text { and } \mathrm{I}_{l}^{2} \subset \mathrm{~J}_{l}\right) .
$$

(b) We have natural commuting actions of P and B on $\mathcal{O}_{\mathrm{X}\left(w_{n-1}\right)}$ induced by the action of P on the left on $\mathrm{X}\left(w_{n-1}\right)$ and the action of B on the right on $\mathrm{X}\left(w_{n-1}\right)$. These actions leave stable the subscheaves I and J of $\mathcal{O}_{\mathbf{x}\left(w_{n-1}\right)}$; in particular, we have commuting actions of $\mathbf{P}$ and B on J (and I) compatible with their action on $\mathrm{X}\left(w_{n-1}\right)$. In particular, it follows that we have commuting actions of P and B on $\mathrm{I} / \mathrm{J}$ compatible with their actions on $\mathrm{X}\left(w_{n-1}\right)$.
(c) It is clear that $\mathrm{I} / \mathrm{J}$ is the sheaf of ideals defining $\mathrm{X}\left(w_{n}\right)=\mathrm{Z}_{\text {red }}$ in Z . In particular, by (a), $\mathbf{I} / \mathbf{J}$ is an $\mathcal{O}_{\mathrm{X}\left(w_{n}\right)}$-module. Similar statements hold for $\mathrm{I}_{r} / \mathbf{J}_{r}$ and $\mathrm{I}_{l} / \mathbf{J}_{l}$. Write $\mathrm{K}=\mathrm{I} / \mathrm{J}$ and similarly define $\mathrm{K}_{r}$ and $\mathrm{K}_{l}$.
(d) We have $\mathrm{K}_{l} \approx \mathcal{O}_{\mathbf{P}^{n-1}}(-1)$, or equivalently, $\left.\mathrm{K} \approx \pi_{l}^{*}\left(\mathcal{O}_{\mathbf{P} \mid \mathbf{G}}(-1)\right)\right|_{\mathrm{X}\left(w_{n}\right)}$. [Recall that $K_{l}$ is a sheaf on $\left(\mathrm{Z}_{l}\right)_{\text {red }}=\left(\mathrm{Y}_{n}\right)_{\text {red }}=\mathbf{P}^{n-1}$.]
To see this, recall that $\mathrm{Z}_{l}=\mathrm{Y}_{n}$ is the subscheme in $\mathbf{P}^{n}$ [with coordinates $\left.\left(0, \ldots, 0, z, y_{1}, \ldots, y_{n}\right)\right]$ defined by $z^{2}=0$. Now $z=0$ defines $\left(Z_{l}\right)_{\text {red }}$ which is a hyperplane in $\mathbf{P}^{n}$ and hence its sheaf of ideals $\approx \mathcal{O}_{\mathbf{P}^{n}}(-1)$. But $\mathrm{Z}_{l}$ is defined by the square of this sheaf of ideals, i. e., by the sheaf $\mathcal{O}_{\mathbf{p}^{n}}(-2)$. We have

$$
\begin{aligned}
\mathrm{K}_{l}=\mathrm{I}_{l} / \mathrm{J}_{l} & \approx \operatorname{Ker}\left(\mathcal{O}_{\mathrm{Z}_{l}} \rightarrow \mathcal{O}_{\left(\mathrm{Z}_{l}\right) \mathrm{rcd}}\right) \\
& \approx \operatorname{Coker}\left(\mathcal{O}_{\mathbf{P}^{n}}(-2) \xrightarrow{\text { can. hom. }} \mathcal{O}_{\mathbf{P}^{n}}(-1)\right) .
\end{aligned}
$$

But we have the exact sequence

$$
0 \rightarrow \mathcal{O}_{\mathbf{P}^{n}}(-1) \rightarrow \mathcal{O}_{\mathbf{P}^{n}} \rightarrow \mathcal{O}_{\left(\mathbb{Z}_{l}\right) \text { red }} \rightarrow 0 .
$$

This gives the exact sequence

$$
0 \rightarrow \mathcal{O}_{\mathbf{P}^{n}}(-2) \rightarrow \mathcal{O}_{\mathbf{P}^{n}}(-1) \rightarrow \mathcal{O}_{\left(\mathrm{Z}_{l}\right)_{\mathrm{red}}}(-1) \rightarrow 0
$$

But $\left(\mathrm{Z}_{l}\right)_{\text {red }}=\mathbf{P}^{n-1}$ and hence the assertion.
(e) We see that K is a locally principal $\mathcal{O}_{\mathbf{X}\left(w_{n}\right)}$-module. This is clear from (b) and (d). Similar statements hold for $\mathrm{K}_{r}$ and $\mathrm{K}_{l}$.

Proposition B.9. - The sheaf $\mathrm{K}_{\mathrm{r}}$ on $\mathrm{X}\left(w_{n}\right)_{r}$ is isomorphic to the sheaf of germs of sections of the line bundle $\left.\mathrm{L}\left(-\chi_{n}\right)\right|_{\mathrm{X}\left(w_{n}\right)_{r}}$. In particular, we have an exact sequence

$$
0 \rightarrow \mathbf{L}\left(-\chi_{n}\right) \rightarrow \mathcal{O}_{\mathbf{Z}_{r}} \rightarrow \mathcal{O}_{\mathbf{X}\left(w_{n}\right)_{r}} \rightarrow 0
$$

where $L\left(-\chi_{n}\right)$ denotes the sheaf associated to $L\left(-\chi_{n}\right)$.
Proof. - We have seen that K is locally principal on $\mathrm{X}\left(w_{n}\right)$ and that we have actions of P and B on K compatible with the actions on $\mathrm{X}\left(w_{n}\right)$. Hence K defines a line bundle say M on $\mathrm{X}\left(w_{n}\right)$ on which we are given commuting actions of P and B such that if $q: \mathrm{M} \rightarrow \mathrm{X}\left(w_{n}\right)$ is the canonical projection, then $q$ is a P-B equivariant morphism. We denote by $M_{r}$ and $M_{l}$ the line bundles defined by $K_{r}$ and $K_{l}$ respectively.

Now the proposition is a consequence of the
Claim. - There exists a non-zero ( $\mathrm{P}-\mathrm{B}$ ) invariant rational section of M over $\mathrm{X}\left(w_{n}\right)$, i.e., a rational section $s: \mathrm{X}\left(w_{n}\right) \rightarrow \mathrm{M}$ :

$$
\begin{gathered}
\mathrm{M} \\
q \downarrow \uparrow s \\
\mathrm{X}\left(w_{n}\right)
\end{gathered}
$$

such that $s(p x b)=p s(x) b$ for all $p \in \mathrm{P}$ and $b \in \mathrm{~B}$.
Suppose the claim is proved. Let $s$ be such a section. Then $s$ gives rise to non-zero rational sections $s_{r}$ and $s_{l}$ of $\mathrm{M}_{r}$ and $\mathrm{M}_{l}$ respectively. Further we have $\pi_{r}^{*}\left(s_{r}\right)=s=\pi_{l}^{*}\left(s_{l}\right)$, etc. We see that $s$ cannot be non-zero everywhere, for otherwise, $s_{l}$ would be an everywhere non-zero section of $\mathcal{O}_{\mathbf{p}^{n-1}}(-1)$ which is a contradiction.

Let $\mathrm{D}\left(\right.$ resp. $\mathrm{D}_{r}$, resp. $\mathrm{D}_{l}$ ) be the union of the polar and zero sets of $s\left(\right.$ resp. $s_{r}$, resp. $s_{l}$ ). Then we have $\pi_{r}^{*}\left(\mathrm{D}_{r}\right)=\mathrm{D}=\pi_{l}^{*}\left(\mathrm{D}_{l}\right)$. Now $\mathrm{D}\left(\right.$ resp. $\mathrm{D}_{r}$, resp. $\left.\mathrm{D}_{l}\right)$ is of pure codimension 1 in $\mathrm{X}\left(w_{n}\right)$ [resp. $\mathrm{X}\left(w_{n}\right)_{r}$, resp. $\mathrm{X}\left(w_{n}\right)_{l}=\left(\mathrm{Y}_{n}\right)_{\text {red }}$ ]. Now D is P-B stable and so $\mathrm{D}_{l}$ is a non-empty pure codimension 1 subset of $\left(\mathrm{Y}_{n}\right)_{\text {red }}$ which is also B-stable and hence $D_{l}$ is a union of some codimension 1 Schubert varieties of $\left(Y_{n}\right)_{\text {red }}$. But we know that $Y_{n+2}$ is the only codimension 1 subvariety of $\left(Y_{n}\right)_{\text {red }}$. Hence $\mathrm{D}_{l}=\mathrm{Y}_{n+2}$ (set-theoretically). We see also that $s_{l}$ has a pole of order 1 along the subvariety $\mathrm{Y}_{n+2} \approx \mathbf{P}^{n-2}$ since $s_{l}$ represents a rational section of $\mathcal{O}_{\mathbf{P}^{n-1}}(-1)$. From this it follows that $s_{l}$ has a pole of order 1 along $\mathrm{Y}_{n+2}$ and is non-zero on $\left(\mathrm{Y}_{n}\right)_{\mathrm{red}}-\mathrm{Y}_{n+2}$, consequently, the section $s_{r}$ of $\mathbf{M}_{r}$ is non-zero at every point of $\mathbf{X}\left(w_{n}\right)_{r}-\mathbf{X}\left(w_{n+1}\right)_{r}$ and it has a pole of order 1 along $\mathrm{X}\left(w_{n+1}\right)_{r}$. Now we know that the ideal sheaf of $\mathrm{X}\left(w_{n+1}\right)_{r}$ in $\mathrm{X}\left(w_{n}\right)_{r}$ is $\left.\approx \mathrm{L}\left(-\chi_{n}\right)\right|_{\mathrm{X}\left(w_{n}\right) r}$ (cf. Proposition B.7). It follows therefore that $\left.\mathrm{K}_{r} \approx \mathrm{~L}\left(-\chi_{n}\right)\right|_{\mathrm{X}\left(w_{n}\right) \mathrm{r}}$. Thus we have
only to prove the existence of a non-zero P-B invariant section of M . But this is a general fact as assured by the following

Lemma B.10. - Let G be a semi-simple algebraic group, B a Borel subgroup and $\mathrm{P} \supset \mathrm{B}$ a parabolic subgroup. Let $w \in \mathrm{~W}$ be such that $\mathrm{X}=\overline{\mathrm{P} w \mathrm{~B}}=\overline{\mathrm{B} w \mathrm{~B}}$ and let M be a line bundle on X on which P and B operate compatibly with their action on X . Then there exists a $\mathrm{P}-\mathrm{B}$ invariant rational section $s$ of M such that $s(x) \neq 0$ for all $x \in \mathrm{Z}=\mathrm{P} w \mathrm{~B}$, in particular there exists a non-zero $\mathrm{P}-\mathrm{B}$ invariant section of M .

Proof. - Let $X_{l}\left(\right.$ resp. $X_{r}$ ) denote the Schubert variety in $P \backslash G$ (resp. G/B) defined by X . The morphisms $\mathrm{X} \rightarrow \mathrm{X}_{l}$ and $\mathrm{X} \rightarrow \mathrm{X}_{r}$ are locally trivial principal fibrations with structure groups P and B respectively, and because of the hypothesis of $\mathrm{P}-\mathrm{B}$ operation on M, M " goes down " to a line bundle $\mathrm{M}_{r}$ on $\mathrm{X}_{r}$ (resp. $\mathrm{M}_{l}$ on $\mathrm{X}_{l}$ ). The (right) action of B on M induces a (right) action of B on $\mathrm{M}_{l}$ compatible with the action of B on $\mathrm{X}_{l}$ (similarly, we have a left action of P on $\mathrm{M}_{r}$ ). The existence of a section $s$ on X such that $s(x) \neq 0$ for all $x \in \mathrm{Z}=\mathrm{P} w \mathrm{~B}$ is easily seen to be equivalent to the existence of a B-invariant section $s_{l}$ of $\mathbf{M}_{l}$ such that $s_{l}(x) \neq 0$ for all $x \in \mathbf{Z}_{l}$ where $\mathbf{Z}_{l}$ is the open Schubert cell in $\mathbf{X}_{l}$. We know that $\mathrm{Z}_{l}$ is the $\mathrm{B}^{u}$-orbit through the point $w_{\mathrm{P}}=\mathrm{P} w$ in $\mathrm{X}_{l}$. Let $\mathrm{B}_{1}$ be the isotropy subgroup of $\mathrm{B}^{u}$ at $w_{\mathrm{P}}$. Let $\mathrm{M}_{0}$ be the fibre of the line bundle $\mathrm{M}_{l}$ over the point $w_{\mathrm{p}} \in \mathrm{X}_{l}$. We make the

Claim. - $\mathrm{B}_{1}$ operates trivially on $\mathrm{M}_{0}$.
This is so because $B_{1}$ operates through a character of $B_{1}$ identifying $M_{0}$ with the affine line, and $B_{1}$ being unipotent, every character of $B_{1}$ is trivial.

Recall that $B_{1}$ is the subgroup of $G$ generated by $H_{\alpha}, \alpha \in S_{1}$ for some subset $S_{1}$ of positive roots $\mathrm{R}^{+}$. Let $\mathrm{S}_{2}=\mathrm{R}^{+}-\mathrm{S}_{1}$ and let $\mathrm{B}_{2}$ be the subgroup generated by $\mathrm{H}_{\alpha}, \alpha \in \mathrm{S}_{2}$. Since any element $b \in \mathrm{~B}^{u}$ can be uniquely written as $b=b_{1} b_{2}$ with $b_{1} \in \mathrm{~B}_{1}$ and $b_{2} \in \mathrm{~B}_{2}$, it follows that given $x \in \mathrm{Z}_{1}$, there exists a unique element $\mathrm{b}_{2} \in \mathrm{~B}_{2}$ such that $x=w_{\mathrm{P}} b_{2}$.

Now define a rational section $s_{l}$ of $\mathbf{M}_{l}$ as follows. Take some $\theta \in \mathbf{M}_{0}, \theta \neq 0$. Write $x \in \mathrm{Z}_{l}$ as $x=w_{\mathrm{P}} b_{2}$ as above. Then set $s_{l}\left(w_{\mathrm{p}}\right)=\theta$ and $s_{l}(x)=\theta b_{2}$. It follows that $s_{l}$ defines an everywhere non-zero section of $\left.\mathbf{M}_{l}\right|_{\mathbf{z}_{l}}$ and hence it is also a rational section of $M_{l}$.

Finally to conclude the proof of the lemma, it suffices to prove that $s_{l}$ is B -invariant. For this, it suffices to show that $\left.s_{l}\right|_{\mathrm{Z}_{l}}$ is $\mathrm{B}^{u}$-invariant. But this is equivalent to showing

$$
s_{l}\left(w_{\mathrm{P}} b\right)=s_{l}\left(w_{\mathrm{P}}\right) b \quad \text { for } \quad b \in \mathrm{~B} .
$$

This is true for $b \in \mathrm{~B}_{2}$ (by definition of $s_{l}$ ) and since $\mathrm{B}=\mathrm{B}_{1} . \mathrm{B}_{2}$, it suffices to check ( $\boldsymbol{*}$ ) for $b \in \mathrm{~B}_{1}$. We have $w_{\mathrm{P}} b=w_{\mathrm{P}}$ for $b \in \mathrm{~B}_{1}$. Further, we know that $\mathrm{B}_{1}$ operates trivially on $\mathbf{M}_{0}$ which implies that $s_{l}\left(w_{\mathbf{p}} b\right)=s_{l}\left(w_{\mathrm{p}}\right)=s_{l}\left(w_{\mathrm{p}}\right) b$ for $b \in \mathbf{B}_{1}$.

This completes the proof of the lemma and consequently the proposition.
8. Vanishing Theorem.

Theorem B.11. - For every line bundle $\mathrm{L}(\chi)$ on $\mathrm{G} / \mathrm{B}$ belonging to the dominant chamber, we have

$$
\mathrm{H}^{p}\left(\mathrm{X}\left(w_{i}\right)_{r},\left.\mathrm{~L}(\chi)\right|_{\left.\mathrm{X}\left(w_{i}\right)_{r}\right)}\right)=0 \text { for all } p>0
$$

[^4]and $i=0, \ldots, 2 n-1$. In particular for $i=0$, we have
$$
\mathrm{H}^{p}(\mathrm{G} / \mathrm{B}, \mathrm{~L}(\chi))=0 \text { for all } p>0
$$

Proof. - Write $\mathrm{X}_{i}=\mathrm{X}\left(w_{i}\right)_{r}, 0 \leqq i \leqq 2 n-1$.
Proceeding as in the proof of Theorem A.8, by increasing induction on the integer $\left(\chi, \alpha_{n-j-1}^{*}\right)$ i. e., degree of $L(\chi)$ with respect to the $\mathbf{P}^{1}$-fibration $G / B \rightarrow G / P_{\alpha_{n-j-1}}$, where $i=n+j, \quad 0 \leqq j \leqq n-2$, we find that the theorem is true for $\mathrm{X}_{i}, n \leqq i \leqq 2 n-1$. Assuming that we have proved the theorem for $X_{n-1}$, again by the same procedure [now the induction being on $\left(\chi, \alpha_{i+1}^{*}\right)$ we find that the theorem is also true for $\left.\mathrm{X}_{i}, 0 \leqq i \leqq n-2\right]$. Thus we have only to prove the theorem for $X_{n-1}$, remembering that the theorem is true (for $\mathrm{X}_{i}, i \geqq n$ ) in particular for $\mathrm{X}_{n}$.

Proof of the theorem for $\mathbf{X}_{n-1}$. - Since no confusion is likely, we simply write [by abuse of notation see $7(b)$ above] $Z$ for $Z_{r}$, I for $I_{r}$, etc. Recall that $Z$ is the (closed) subscheme of $X_{n-1}\left(Z_{\text {red }}=X_{n}\right)$ whose sheaf of ideals $(J)$ is generated by the section of the line bundle $\left.L\left(\chi_{n-1}\right)\right|_{X_{n-1}}$ vanishing along $X_{n}$ and that $K$, which is isomorphic to the sheaf of germs of sections of the line bundle $\left.\mathrm{L}\left(-\chi_{n}\right)\right|_{\mathrm{X}_{n}}$ (cf. Proposition B.9), is the sheaf of ideals defining $X_{n}$ in $Z$. Notice that $K$ is also canonically a sheaf of $\mathcal{O}_{\mathbf{x}_{n}}$-modules. We have the exact sequence

$$
\left.0 \rightarrow \mathrm{~L}\left(-\chi_{n}\right)\right|_{\mathrm{x}_{n}} \rightarrow \mathcal{O}_{\mathrm{Z}} \rightarrow \mathcal{O}_{\mathbf{x}_{n}} \rightarrow 0
$$

Tensoring this by the given line bundle $L(\chi)$ on $G / B$ we get the exact sequence

$$
\left.\left.\left.0 \rightarrow \mathrm{~L}\left(\chi-\chi_{n}\right)\right|_{\mathrm{x}_{n}} \rightarrow \mathrm{~L}(\chi)\right|_{\mathrm{z}} \rightarrow \mathrm{~L}(\chi)\right|_{\mathrm{x}_{n} \rightarrow 0}
$$

Recall that $\chi_{n}=\tilde{\omega}_{n-1}-2 \tilde{\omega}_{n}\left(c f\right.$. Proposition B.6). Write $\chi^{\prime}=\chi-\chi_{n}=\chi-\tilde{\omega}_{n-1}+2 \tilde{\omega}_{n}$. We have the cohomology exact sequence

$$
\rightarrow \mathrm{H}^{p}\left(\mathrm{X}_{n}, \mathrm{~L}\left(\chi^{\prime}\right)\right) \rightarrow \mathrm{H}^{p}(\mathrm{Z}, \mathrm{~L}(\chi)) \rightarrow \mathrm{H}^{p}\left(\mathrm{X}_{n}, \mathrm{~L}(\chi)\right) \rightarrow
$$

Now we prove

$$
\begin{equation*}
\mathrm{H}^{p}(\mathrm{Z}, \mathrm{~L}(\chi))=0 \quad \text { for all } p>0 \tag{I}
\end{equation*}
$$

To see this, observe that $\mathrm{H}^{p}\left(\mathrm{X}_{n}, \mathrm{~L}(\chi)\right)=0$ for $p>0$ (the theorem being true for $\mathrm{X}_{n}$ by induction). Hence we have only to prove that $H^{p}\left(X_{n}, \mathrm{~L}\left(\chi^{\prime}\right)\right)=0$ for $p>0$. We prove this by induction on $\left(\chi^{\prime}, \alpha_{n-1}^{*}\right)$. Notice that

$$
\begin{equation*}
\left(\chi^{\prime}, \alpha_{n-1}^{*}\right)=\left(\chi, \alpha_{n-1}^{*}\right)-1 \geqq-1 \tag{i}
\end{equation*}
$$

and

$$
\begin{equation*}
\left(\chi^{\prime}, \alpha_{j}^{*}\right) \geqq\left(\chi, \alpha_{j}^{*}\right) \geqq 0 \quad \text { for } \quad j \neq n-1 \tag{ii}
\end{equation*}
$$

Suppose $\left(\chi^{\prime}, \alpha_{n-1}^{*}\right)=-1$. Then by Remark B. 3 (ii) and Corollary 1.15, we find that the claim is true. Assume $\left(\chi^{\prime}, \alpha_{n-1}^{*}\right) \geqq 0$. Now by (ii) above, $\chi^{\prime} \geqq 0$ and so (I) follows since the theorem is true for $X_{n}$.

We prove the theorem for $X_{n-1}$ by induction on $\left(\chi, \alpha_{n}^{*}\right)$. Let us verify the result when $\left(\chi, \alpha_{n}^{*}\right)=0$.

$$
\begin{equation*}
\left(\chi, \alpha_{n}^{*}\right)=0 \Rightarrow H^{p}\left(X_{n-1}, L(\chi)\right)=0 \quad \text { for } \quad p>0 \tag{II}
\end{equation*}
$$

To see this, let I denote the sheaf of ideals defining the closed subscheme $X_{n}$ in $X_{n-1}$. We have an exact sequence

$$
0 \rightarrow \mathrm{I} \rightarrow \mathcal{O}_{\mathbf{X}_{n-1}} \rightarrow \mathcal{O}_{\mathbf{X}_{n}} \rightarrow 0
$$

Tensoring with $L(\chi)$, we get the exact sequence

$$
\left.\left.\left.0 \rightarrow \mathrm{I} \otimes \mathrm{~L}(\chi)\right|_{\mathrm{x}_{n-1}} \rightarrow \mathrm{~L}(\chi)\right|_{\mathrm{x}_{n-1}} \rightarrow \mathrm{~L}(\chi)\right|_{\mathrm{x}_{n}} \rightarrow 0
$$

This gives the exact sequence

$$
\rightarrow \mathrm{H}^{p}\left(\mathrm{X}_{n-1}, \mathrm{I} \otimes \mathrm{~L}(\chi)\right) \rightarrow \mathrm{H}^{p}\left(\mathrm{X}_{n-1}, \mathrm{~L}(\chi)\right) \rightarrow \mathrm{H}^{p}\left(\mathrm{X}_{n}, \mathrm{~L}(\chi)\right) \rightarrow
$$

By induction

$$
\mathrm{H}^{p}\left(\mathrm{X}_{n}, \mathrm{~L}(\chi)\right)=0 \quad \text { for } \quad p>0
$$

and so we have only to prove that

$$
\mathrm{H}^{p}\left(\mathrm{X}_{n-1}, \mathrm{I} \otimes \mathrm{~L}(\chi)\right)=0 \quad \text { for } \quad p>0
$$

To see this, recall that $I$ is the sheaf associated to the Weil divisor $X_{n}$ (note $2 X_{n}=Z$ ) i. e., the sheaf of germs of sections of $L\left(-\chi_{n-1}\right)$, etc. It follows that the degree of $I$ with respect to the $\mathbf{P}^{1}$-fibration $X_{n-1} \rightarrow X_{n-1} / \mathbf{P}_{\alpha_{n}}$ [cf. Remark B. 3 (ii)] is precisely -1 . Hence the degree of $\mathrm{I} \otimes \mathrm{L}(\chi)$ with respect to this $\mathbf{P}^{1}$-fibration is $-1\left[\operatorname{since}\left(\chi, \alpha_{n}^{*}\right)=0\right]$. Hence by Proposition 1.14, (since $X_{n-1}$ is normal) we get that

$$
\mathrm{H}^{p}\left(\mathrm{X}_{n-1}, \mathrm{I} \otimes \mathrm{~L}(\chi)\right)=0 \quad \text { for } \quad p \geqq 0
$$

This proves (II). Finally
(III) Assume $\left(\chi, \alpha_{n}^{*}\right) \geqq 1$ and the induction hypothesis [for all $\chi^{\prime} \geqq 0$ we have

$$
\left.\left(\chi^{\prime}, \alpha_{n}^{*}\right)<\left(\chi, \alpha_{n}^{*}\right) \quad \Rightarrow \quad \mathrm{H}^{p}\left(\mathrm{X}_{n-1}, \mathrm{~L}\left(\chi^{\prime}\right)\right)=0 \quad \text { for all } p>0\right]
$$

We have the exact sequence

$$
\left.0 \rightarrow \mathrm{~L}\left(-\chi_{n-1}\right)\right|_{\mathrm{X}_{n-1}} \rightarrow \mathcal{O}_{\mathrm{X}_{n-1}} \rightarrow \mathcal{O}_{\mathrm{Z}} \rightarrow 0
$$

which gives the exact sequence

$$
\left.\left.\left.0 \rightarrow \mathrm{~L}\left(\chi-\chi_{n-1}\right)\right|_{\mathrm{x}_{n-1}} \rightarrow \mathrm{~L}(\chi)\right|_{\mathrm{x}_{n-1}} \rightarrow \mathrm{~L}(\chi)\right|_{\mathrm{z}} \rightarrow 0
$$

Recall that $\chi_{n-1}=2 \tilde{\omega}_{n}-\tilde{\omega}_{n-1}$ (cf. Proposition B.6). Write

$$
\chi^{\prime}=\chi-\chi_{n-1}=\chi+\tilde{\omega}_{n-1}-2 \tilde{\omega}_{n}
$$

We have the cohomology exact sequence

$$
\rightarrow \mathrm{H}^{p}\left(\mathrm{X}_{n-1}, \mathrm{~L}\left(\chi^{\prime}\right)\right) \rightarrow \mathrm{H}^{p}\left(\mathrm{X}_{n-1}, \mathrm{~L}(\chi)\right) \rightarrow \mathrm{H}^{p}(\mathrm{Z}, \mathrm{~L}(\chi)) \rightarrow
$$

```
4e Série - tome 7 - 1974 - no 1
```

This reduces [by (I)] to the exact sequences
( $\star$ )

$$
\mathrm{H}^{p}\left(\mathrm{X}_{n-1}, \mathrm{~L}\left(\chi^{\prime}\right)\right) \rightarrow \mathrm{H}^{p}\left(\mathrm{X}_{n-1}, \mathrm{~L}(\chi)\right) \rightarrow 0
$$

for all $p \geqq 1$. Notice that we have $\left(\chi^{\prime}, \alpha_{n}^{*}\right)=\left(\chi, \alpha_{n}^{*}\right)-2$ and $\left(\chi^{\prime}, \alpha_{j}^{*}\right) \geqq\left(\chi, \alpha_{j}^{*}\right)$ for $j \neq n$. In particular $\chi^{\prime} \geqq 0$ if $\left(\chi, \alpha_{n}^{*}\right) \geqq 2$. Now by Remark B. 3 (ii) and Corollary 1.15, $(\star)$ and the induction hypothesis, we get the result whenever $\left(\chi, \alpha_{n}^{*}\right)$ is odd. Similarly, by (II), $(\boldsymbol{\star})$ and the induction hypothesis, we get the result whenever $\left(\chi, \alpha_{n}^{*}\right)$ is even.
This completes the proof of the theorem.

$$
\text { C. } \operatorname{TYPE} \mathbf{C}_{n}(n \geqq 2)
$$

1. Numerical data. - Recall the following facts for a group $G$ of type $\mathbf{C}_{n}$.

Dynkin diagram :

The Cartan numbers

$$
n_{i j}=\left(\alpha_{i}, \alpha_{j}^{*}\right)=2\left(\alpha_{i}, \alpha_{j}\right) /\left(\alpha_{j}, \alpha_{j}\right)
$$

are given by

$$
n_{i j}=\left\{\begin{aligned}
2 & \text { if } \quad i=j, \\
-1 & \text { if } i=j \pm 1 \text { and } i, j \leqq n-1, \\
-1 & \text { if }(i, j)=(n-1, n), \\
-2 & \text { if }(i, j)=(n, n-1), \\
0 & \text { otherwise. }
\end{aligned}\right.
$$

The number of roots $=2 n^{2}$.
The order of the Weyl group $\mathrm{W}\left(=\mathrm{W}\left(\mathbf{C}_{n}\right)\right)$ of $\mathrm{G}=2^{n} . n$ !
2. A reduced expression for $w_{0}$.

Proposition C.1. - A reduced expression for the element $w_{0} \in \mathrm{~W}$ (of largest length) is given by

$$
w_{0}=s_{n}\left(s_{n-1} s_{n} s_{n-1}\right) \ldots\left(s_{i} s_{i+1} \ldots s_{n} s_{n-1} \ldots s_{i}\right) \ldots\left(s_{1} \ldots s_{n} s_{n-1} \ldots s_{1}\right) .
$$

Proof. - Similar to that of Proposition A.1. In this case we define the sequences $\left\{v_{i}\right\}$ and $\left\{u_{i}\right\}$ as follows:

$$
\begin{array}{llll}
\left\{v_{i}\right\}: & v_{n}=s_{n}, & v_{i}=s_{i} v_{i+1} s_{i}, & \\
\left\{\begin{array}{lll}
1 \leqq i<n ; \\
\left.u_{i}\right\}: & u_{n}=v_{n}, & u_{i}=u_{i+1} v_{i},
\end{array}\right. & 1 \leqq i<n .
\end{array}
$$

The following assertion for $u_{1}$ together with Proposition 1.1 (iii) proves the assertion.

## Assertion I.

$$
u_{i}\left(\alpha_{j}\right)=\left\{\begin{array}{cc}
-\alpha_{j} & \text { for } i \leqq j \leqq n \\
\left(\alpha_{i-1}+2 \alpha_{i}+\ldots+2 \alpha_{n-1}+\alpha_{n}\right) & \text { for } j=i-1 \\
\alpha_{j} & \text { for } j \leqq i-2
\end{array}\right.
$$

(In particular $u_{1}=-$ Id.)
We prove this by decreasing induction on $i$ using the fact that $u_{i}=u_{i+1} v_{i}$ and the values $v_{i}\left(\alpha_{j}\right)$ from the following

Assertion II. - We have

$$
v_{i}\left(\alpha_{j}\right)=\left\{\begin{array}{cl}
\alpha_{j} & \text { for } j \neq i-1 \text { and } i, \\
-\left(\alpha_{i}+2 \alpha_{i+1}+\ldots+2 \alpha_{n-1}+\alpha_{n}\right) & \text { for } j=i, \\
\left(\alpha_{i-1}+2 \alpha_{i}+\ldots+2 \alpha_{n-1}+\alpha_{n}\right) & \text { for } j=i-1
\end{array}\right.
$$

We prove this again by decreasing induction $i$ noting that $v_{i}=s_{i} v_{i+1} s_{i}$.
3. The Parabolic subgroup $\mathbf{P}\left(=\mathrm{P}_{\hat{\alpha}_{1}}\right)$. - $\mathbf{P}=\mathrm{P}_{\hat{\alpha}_{1}}$ admits a similar description as before, namely, the "semi-simple part" of P is of type $\mathrm{C}_{n-1}$ (or $\mathrm{A}_{1}$ if $n=2$ ) and its Dynkin diagram can be taken to be

In particular, the element $w_{0}^{\prime}$ in the Weyl group $\mathrm{W}_{\mathrm{P}}\left(=\mathrm{W}\left(\mathrm{C}_{n-1}\right)\right)$ of P is given by

$$
w_{0}^{\prime}=s_{n}\left(s_{n-1} s_{n} s_{n-1}\right) \ldots\left(s_{i} \ldots s_{n} \ldots s_{i}\right) \ldots\left(s_{2} \ldots s_{n} \ldots s_{2}\right)
$$

Thus we have $w_{0}=w_{0}^{\prime}\left(s_{1} \ldots s_{n} \ldots s_{1}\right)$. The number of Schubert varieties in

$$
\mathrm{P} \backslash \mathrm{G}=\left[\mathrm{W}: \mathrm{W}_{\mathrm{P}}\right]=2 n
$$

4. The family of closed Bruhat cells $\left\{\mathbf{X}\left(w_{i}\right)\right\}$. - Define the sequences $\left\{r_{i}\right\},\left\{\tau_{i}\right\}$ and $\left\{w_{i}\right\}$ of elements in W as follows:

$$
\begin{aligned}
\left\{r_{i}\right\}: & r_{0}=\mathrm{Id}, \quad r_{1}=s_{1}, \ldots, r_{n}=s_{n} \\
& r_{n+1}=s_{n-1}, \ldots, r_{n+i}=s_{n-i}, \ldots, r_{2 n-1}=s_{1} \\
\left\{\tau_{i}\right\}: & \tau_{0}=\mathrm{Id}, \quad \tau_{i}=r_{2 n-1} \ldots r_{2 n-i}, \quad 0 \leqq i \leqq 2 n-1 \\
\left\{w_{i}\right\}: & w_{i}=w_{0} \tau_{i}=w_{0}^{\prime} r_{1} \ldots r_{2 n-1-i}, \quad 0 \leqq i \leqq 2 n-1 .
\end{aligned}
$$

## Proposition C. 2 .

$$
\begin{equation*}
\mathrm{G}=\mathrm{X}\left(w_{0}\right) \supset \mathrm{X}\left(w_{1}\right) \supset \ldots \supset \mathrm{X}\left(w_{2 n-1}\right)=\mathrm{P} \tag{i}
\end{equation*}
$$

(ii) Each $\mathrm{X}\left(w_{i}\right)$ is of codimension 1 in $\mathrm{X}\left(w_{i-1}\right)$.
(iii) $\mathrm{X}\left(w_{i}\right)$ are the inverse images (under the natural morphism $\mathrm{G} \rightarrow \mathrm{P} \backslash \mathrm{G}$ ) of the Schubert varieties in $\mathrm{P} \backslash \mathrm{G}$.

Proof. - Similar to that of Proposition A. 2.
Remark C.3. - We have

$$
\begin{equation*}
\mathrm{X}\left(w_{i}\right)=\mathrm{P} w_{i} \mathrm{~B} \cup \mathrm{X}\left(w_{i+1}\right), \quad 0 \leqq i \leqq 2 n-2 \tag{i}
\end{equation*}
$$

the union being set-theoretic and disjoint
(ii) $\mathrm{X}\left(w_{i}\right)$ is stable for multiplication on the right by the (minimal) parabolic subgroup $\mathrm{P}_{\alpha_{i+1}}$ if $0 \leqq i \leqq n-1$ or $\mathrm{P}_{\alpha_{n-j-1}}$ if $i=n+j, 0 \leqq j \leqq n-2$.

Proof. - Similar to that of Remark A. 3.
Proposition C.4. - We have (set-theoretically):

$$
\mathrm{X}\left(w_{i}\right) \cap \mathrm{X}\left(w_{1}\right) \tau_{i}=\mathbf{X}\left(w_{i+1}\right), \quad 0 \leqq i \leqq 2 n-2
$$

(where $\tau_{i}=w_{0} w_{i}$ ).
Proof. - Similar to that of Proposition A.4.
Proposition C.5. - Let $\chi_{i}=\tau_{i}^{-1}\left(\tilde{\omega}_{1}\right), 0 \leqq i \leqq 2 n-2$. For each $i$, there exists an element $f_{i} \in \mathbf{H}^{0}\left(\mathbf{X}\left(w_{i}\right)_{r},\left.\mathrm{~L}\left(\chi_{i}\right)\right|_{\mathbf{X}\left(w_{i}\right) r}\right)$ such that (set-theoretically) the set of zeros of $f_{i}$ in $\mathrm{X}\left(w_{i}\right)_{r}$ is $\mathrm{X}\left(w_{i+1}\right)_{r}$.

Proof. - Same (word by word) as in Proposition B. 5.
5. The family of characters $\left\{\chi_{i}\right\}$.

Proposition C.6. - The characters $\chi_{i}\left(=\tau_{i}^{-1}\left(\tilde{\omega}_{1}\right)\right), 0 \leqq i \leqq 2 n-2$, are given by $\chi_{0}=\tilde{\omega}_{1}$ and

$$
\begin{equation*}
\chi_{i}=\tilde{\omega}_{i+1}-\tilde{\omega}_{i} \quad \text { for } \quad 1 \leqq i \leqq n-1 \tag{a}
\end{equation*}
$$

$$
\begin{equation*}
\chi_{n}=\tilde{\omega}_{n-1}-\tilde{\omega}_{n} \tag{b}
\end{equation*}
$$

$$
\begin{equation*}
\chi_{n+j}=\tilde{\omega}_{n-j-1}-\tilde{\omega}_{n-j} \quad \text { for } \quad 1 \leqq j \leqq n-2 \tag{c}
\end{equation*}
$$

Proof. - Similar to that of Proposition B.6. In this case the recurrence relations are (same as in type $\mathbf{B}_{n}$ ):

$$
\tau_{i}=s_{1} \ldots s_{i}=\tau_{i-1} s_{i} \quad \text { for } 1 \leqq i \leqq n \quad \text { and } \quad \tau_{n+j}=\tau_{n+j-1} s_{n-j} \text { for } 1 \leqq j \leqq n-1
$$

6. Structure of Schubert varieties in $\mathrm{P} \backslash \mathrm{G}$. - Here we take $\mathrm{G}=\mathrm{Sp}_{2 n}$, the Symplectic group (cf. [2], [7], [23] or [25]). Recall that $\mathrm{Sp}_{2 n}$ is realised as a subgroup of GL (2n) as follows : let

$$
M=\left(\begin{array}{ccccc} 
& 0 & & & 1 \\
& & . & \\
& -1 & & 0
\end{array}\right)
$$

ANNALES SGIENTIFIQUES DE L'ÉCOLE NORMALE SUPÉRIEURT
be the skew-symmetric matrix, i. e., with 1 or -1 at the ( $i, 2 n-i+1$ )-th place according as $i \leqq n$ or $\geqq n+1$ and 0 elsewhere. Then

$$
\mathrm{Sp}_{2 n}=\left\{\mathrm{A} \in \mathrm{GL}(2 n) / \mathrm{AMA}^{t}=\mathrm{M}\right\}
$$

For this imbedding $\operatorname{Sp}_{2 n} \subsetneq$ GL (2n), the subgroup T (resp. B) of $\mathrm{Sp}_{2 n}$ consisting of the diagonal (resp. upper triangular) matrices is a maximal torus (resp. Borel subgroup). Fixing these, it is easy to check that $\mathrm{P}=\mathrm{P}_{\hat{\alpha}_{1}}$ is precisely the subgroup of $\mathrm{Sp}_{2_{n}}$ consisting of matrices of the form $\left(g_{i j}\right) \in \mathrm{Sp}_{2 n}$ such that $g_{i 1}=0$ for $i \geqq 2$ and $g_{2 n j}=0$ for $j \leqq 2 n-1$, i. e., of the form

$$
\left(\begin{array}{cccc}
* & * & \ldots & * \\
0 & * & \ldots & * \\
. & \cdots & & * \\
0 & 0 & \ldots & 0
\end{array}\right)
$$

and its "semi-simple part" is the set of matrices of the form

$$
\left(\begin{array}{cccc}
1 & 0 & \ldots & 0 \\
0 & \square & 0 \\
\vdots & X & \vdots \\
0 & 0 & \ldots & 1
\end{array}\right) \approx \operatorname{Sp}_{2 n-2}
$$

Let $\mathrm{P}^{\prime}$ be the (maximal) parabolic subgroup of $\mathrm{GL}(2 n)$ consisting of the matrices of the form

$$
\left(\begin{array}{llll}
* & * & \cdots & * \\
0 & * & & * \\
0 & * & \cdots & *
\end{array}\right)
$$

It is easy to check that $\mathrm{P}=\mathrm{Sp}_{2 n} \cap \mathrm{P}^{\prime}$ (scheme-theoretically).
Claim. - The canonic al closed immersion $\mathrm{P} \backslash \mathrm{G} G \mathrm{P}^{\prime} \backslash \mathrm{GL}(2 n)$ is an isomorphism i.e., $\mathrm{P} \backslash \mathrm{G} \approx \mathbf{P}(\mathrm{V})$ where V is a vector space of dimension $2 n$.

This is immediate from the consideration of dimension, etc.
As in the case of type $\mathbf{A}_{n}$, fixing a coordinate system $\left(x_{1}, \ldots, x_{2 n}\right)$ on $V$, we see that the Schubert varieties in $\mathrm{P} \backslash \mathrm{G}$ are obtained by taking

$$
x_{1}=0 ; \quad x_{1}=x_{2}=0 ; \quad \ldots ; \quad x_{1}=\ldots=x_{2 n-1}=0
$$

In particular (these are non-singular and) each is obtained from the previous one with the (scheme-theoretic) intersection of a hyper-plane in $\mathbf{P}(\mathrm{V})$.
7. The ideal sheaf of $\mathrm{X}\left(w_{i}\right)_{r}$ in $\mathrm{X}\left(w_{i-1}\right)_{r}$.

Proposition C.7. - The sheaf of ideals defining $\mathrm{X}\left(w_{i}\right)_{r}$ in $\mathrm{X}\left(w_{i-1}\right)_{r}$ is precisely $\left.\mathrm{L}\left(-\chi_{i}\right)\right|_{\mathrm{X}\left(w_{i}\right) r}$ (i.e., the equalities in Proposition C. 4 and C. 5 are scheme-theoretic).

Proof. - Similar to that of Proposition A.7.

$$
4^{\text {e série }} \text { - томе } 7 \text { - } 1974 — \text { no }^{0} 1
$$

## 8. Vanishing Theorem.

Theorem C.8. - For every line bundle $\mathrm{L}(\chi)$ on $\mathrm{G} / \mathrm{B}$ belonging to the dominant chamber, we have

$$
\mathrm{H}^{p}\left(\left.\mathrm{X}\left(w_{i}\right)_{r} \mathrm{~L}(\chi)\right|_{\mathrm{X}\left(w_{i}\right)_{r}}\right)=0 \text { for all } p>0
$$

and $i=0, \ldots, 2 n-1$. In particular for $i=0$ we have $H^{p}(\mathrm{G} / \mathrm{B}, \mathrm{L}(\chi))=0$ for $p>0$.
Proof. - Similar to that of Theorem A.8. In this case, the proof is by increasing induction on $\left(\chi, \alpha_{i+1}^{*}\right)$ or $\left(\chi, \alpha_{n-j-1}^{*}\right)$ according as $0 \leqq i \leqq n-1$ or $i=n+j, 0 \leqq j \leqq n-2$.

$$
\text { D. TYPE } \mathbf{D}_{n}(n \geqq 3)
$$

Since $\mathbf{D}_{3}=\mathbf{A}_{3}$, we can assume that $n \geqq 4$.

1. Numerical data. - Recall the following facts for a group G of type $\mathbf{D}_{n}$.

Dynkin diagram :

The Cartan numbers

$$
n_{i j}=\left(\alpha_{i}, \alpha_{j}^{*}\right)=2\left(\alpha_{i}, \alpha_{j}\right) /\left(\alpha_{j}, \alpha_{j}\right)
$$

are given by

$$
n_{i j}=\left\{\begin{aligned}
2 & \text { if } i=j \\
-1 & \text { if } i=j \pm 1, i, j \leqq n-1 \\
-1 & \text { if }(i, j)=(n-2, n) \text { or }(n, n-2) \\
0 & \text { otherwise }
\end{aligned}\right.
$$

The number of roots $=2 n(n-1)$.
The order of the Weyl group $\mathrm{W}\left(=\mathrm{W}\left(\mathrm{D}_{n}\right)\right)$ of $\mathrm{G}=2^{n-1} \cdot n$ !
2. A REDUCED EXPRESSION FOR $w_{0}$.

Proposition D. 1. - A reduced expression for the element $w_{0} \in \mathrm{~W}$ (of largest length) is given by

$$
\begin{aligned}
w_{0} & =\left(s_{n-1} s_{n}\right)\left(s_{n-2} s_{n-1} s_{n} s_{n-2}\right) \ldots\left(s_{1} \ldots s_{n-2} s_{n-1} s_{n} s_{n-2} \ldots s_{1}\right) \\
& =\left(s_{n} s_{n-1}\right)\left(s_{n-2} s_{n} s_{n-1} s_{n-2}\right) \ldots\left(s_{1} \ldots s_{n-2} s_{n} s_{n-1} s_{n-2} \ldots s_{1}\right)
\end{aligned}
$$

Proof. - Similar to that of Proposition A. 1. In this case, we define the sequences $\left\{v_{i}\right\}$ and $\left\{u_{i}\right\}$ as follows :

$$
\begin{array}{lllll}
\left\{v_{i}\right\}: & v_{n-1}=s_{n-1} s_{n} & \text { and } & v_{i}=s_{i} v_{i+1} s_{i}, & 1 \leqq i<n-1 ; \\
\left\{u_{i}\right\}: & u_{n-1}=v_{n-1} & \text { and } & u_{i}=u_{i+1} v_{i}, & 1 \leqq i<n-1 .
\end{array}
$$

The following assertion for $u_{1}$ together with Proposition 1.1 (iii) proves the proposition.
Assertion I. - We have
$u_{i}\left(\alpha_{j}\right)=\left\{\begin{array}{ccc}-\alpha_{n} & \text { or }-\alpha_{n-1} & \text { according as } n-i \text { is odd or even, if } j=n \quad(\text { for all } i), \\ -\alpha_{n-1} & \text { or }-\alpha_{n} & \text { according as } n-i \text { is odd or even, if } j=n-1 \\ (\text { for all } i), \\ \left(\alpha_{i-1}+2 \alpha_{i}+\ldots+2 \alpha_{n-2}+\alpha_{n-1}+\alpha_{n}\right) \\ \alpha_{j} \quad \text { for } j \leqq i-2 .\end{array}\right.$
We prove this by decreasing induction on $i$ using $u_{i}=u_{i+1} v_{i}$ and the values of $v_{i}\left(\alpha_{j}\right)$ (for $i \leqq n-2$ ) from the following

ASSERTION II. - We have (for $i \leqq n-2$ ) :

$$
v_{i}\left(\alpha_{j}\right)=\left\{\begin{array}{cc}
\alpha_{j} & \text { for } j \neq i-1, \quad i, \quad n-1 \\
\alpha_{n-1} & \text { for } j=n, \\
\alpha_{n} & \text { for } j=n-1, \\
-\left(\alpha_{i}+2 \alpha_{i+1}+\ldots+2 \alpha_{n-2}+\alpha_{n-1}+\alpha_{n}\right) & \text { for } j=i \\
\left(\alpha_{i-1}+2 \alpha_{i}+\ldots+2 \alpha_{n-2}+\alpha_{n-1}+\alpha_{n}\right) & \text { for } j=i-1 .
\end{array}\right.
$$

We prove this again by decreasing induction on $i$ noting that $v_{i}=s_{i} v_{i+1} s_{i}$.
3. The Parabolic subgroup $P\left(=P_{\hat{\alpha}_{1}}\right)$. - It is easy to see that the "semi-simple part" of $P$ is of type $\mathbf{D}_{n-1}$ and its Dynkin diagram can be taken to be

In particular, the element $w_{0}^{\prime}$ in the Weyl group $W_{P}\left(=W\left(D_{n-1}\right)\right)$ of $P$ is given by

$$
w_{0}^{\prime}=\left(s_{n-1} s_{n}\right)\left(s_{n-2} s_{n-1} s_{n} s_{n-2}\right) \ldots\left(s_{2} \ldots s_{n} s_{n-2} \ldots s_{2}\right)
$$

Thus we have

$$
w_{0}=w_{0}^{\prime}\left(s_{1} \ldots s_{n} s_{n-2} \ldots s_{1}\right)=w_{0}^{\prime}\left(s_{1} \ldots s_{n-1} s_{n} s_{n-1} \ldots s_{1}\right)
$$

The number of Schubert varieties in $\mathrm{P} \backslash \mathrm{G}$ is $\left[\mathrm{W}: \mathrm{W}_{\mathrm{P}}\right]=2 n$.
4. The family of closed Bruhat cells $\left\{\mathbf{X}\left(w_{i}\right), \mathbf{X}\left(w_{n-1}^{\prime}\right)\right\}$. - Define the sequences $\left\{\tau_{i}, \tau_{n-1}^{\prime}\right\}$ and $\left\{w_{i}, w_{n-1}^{\prime}\right\}$ of elements in W as follows :

$$
\begin{aligned}
\left\{\tau_{i} \tau_{n-1}^{\prime}\right\}: & \tau_{0}=\mathrm{Id}, \quad \tau_{i}=\tau_{i-1} s_{i} \quad \text { for } \quad 1 \leqq i \leqq n-2 \\
& \tau_{n-1}=\tau_{n-2} s_{n}, \quad \tau_{n-1}^{\prime}=\tau_{n-2} s_{n-1} \\
& \tau_{n}=\tau_{n-1} s_{n-1}=\tau_{n-1}^{\prime} s_{n}
\end{aligned}
$$

$4^{\mathrm{e}}$ SÉRIE - TOME 7 - $1974-\mathrm{N}^{\mathrm{o}} 1$
and

$$
\begin{array}{ll}
\tau_{n+j}=\tau_{n+j-1} s_{n-j-1}, \quad 1 \leqq j \leqq n-2 \\
\left\{w_{i}, w_{n-1}^{\prime}\right\}: & w_{i}=w_{0} \tau_{i} \quad \text { for } \quad 0 \leqq i \leqq 2 n-2 \quad \text { and } \quad w_{n-1}^{\prime}=w_{0} \tau_{n-1}^{\prime}
\end{array}
$$

Proposition D. 2.

(ii) Each $\mathrm{X}\left(w_{i}\right)$ is of codimension 1 in $\mathrm{X}\left(w_{i-1}\right)$ and also $\mathrm{X}\left(w_{n}\right)\left[r e s p . \mathrm{X}\left(w_{n-1}^{\prime}\right)\right]$ is of codimension 1 in $\mathrm{X}\left(w_{n-1}^{\prime}\right)$ [resp. $\left.\mathrm{X}\left(w_{n-2}\right)\right]$.
(iii) $\mathrm{X}\left(w_{i}\right)$ and $\mathrm{X}\left(w_{n-1}^{\prime}\right)$ are the inverse images (under the natural morphism $\left.\mathrm{G} \rightarrow \mathrm{P} \backslash \mathrm{G}\right)$ of the Schubert varieties in $\mathrm{P} \backslash \mathrm{G}$.

Proof. - Similar to that of Proposition A. 2.
Remark D.3. - We have

$$
\begin{gathered}
\text { (i) } \mathrm{X}\left(w_{i}\right)=\mathrm{P} w_{i} \mathrm{~B} \cup \mathrm{X}\left(w_{i+1}\right) \quad \text { for } 0 \leqq i \leqq n-3 \text { and } n-1 \leqq i \leqq 2 n-3, \\
\mathrm{X}\left(w_{n-1}^{\prime}\right)=\mathrm{P} w_{n-1}^{\prime} \mathrm{B} \cup \mathrm{X}\left(w_{n}\right), \\
\mathrm{X}\left(w_{n-2}\right)=\mathrm{P} w_{n-2} \mathrm{~B} \cup\left(\mathrm{X}\left(w_{n-1}\right) \cup \mathrm{X}\left(w_{n-1}^{\prime}\right)\right),
\end{gathered}
$$

the unions being set-theoretic and disjoint.
(ii)

| Bruhat cell | Stable on the right by the (minimal) parabolic subgroup |
| :---: | :---: |
| $\mathrm{X}\left(w_{i}\right) \ldots$ | $\begin{array}{ll} \mathrm{P}_{\alpha_{i+1}} & \text { for } \quad 0 \leqq i \leqq n-3 \\ \mathrm{P}_{\alpha_{n-1}} & \text { if } \quad i=n-1 \\ \mathrm{P}_{\alpha_{n-j-2}} & \text { for } \quad i=n+j, \quad 0 \leqq j \leqq n-3 \end{array}$ |
| $\begin{aligned} & \mathrm{X}\left(w_{n-2}\right) \ldots \\ & \mathrm{X}\left(w_{n-1}^{\prime}\right) \ldots \end{aligned}$ | $\begin{array}{lll} \mathbf{P}_{\alpha_{n}} & \text { and } & \mathbf{P}_{\alpha_{n-1}} \\ & \mathbf{P}_{\alpha_{n}} & \end{array}$ |

Proof. - Similar to that of Remark A. 3.
Proposition D. 4. - We have (set-theoretically) :
(i) $\mathrm{X}\left(w_{i}\right) \cap \mathrm{X}\left(w_{1}\right) \tau_{i}=\mathrm{X}\left(w_{i+1}\right) \quad$ for $\quad 0 \leqq i \leqq n-3$ or $n-1 \leqq i \leqq 2 n-3$.

$$
\begin{equation*}
\mathrm{X}\left(w_{n-1}^{\prime}\right) \cap \mathrm{X}\left(w_{1}\right) \tau_{n-1}^{\prime}=\mathrm{X}\left(w_{n}\right) \tag{ii}
\end{equation*}
$$

$$
\begin{equation*}
\mathrm{X}\left(w_{n-2}\right) \cap \mathrm{X}\left(w_{1}\right) \tau_{n-2}=\mathrm{X}\left(w_{n-1}\right) \cup \mathrm{X}\left(w_{n-1}^{\prime}\right) \tag{iii}
\end{equation*}
$$

$$
\begin{equation*}
\mathrm{X}\left(w_{n-1}\right) \cap \mathrm{X}\left(w_{n-1}^{\prime}\right)=\mathrm{X}\left(w_{n}\right) \tag{iv}
\end{equation*}
$$

Proof. - Similar to that of Proposition A. 4 (with the obvious modifications).

Proposition D. 5. - Let $\chi_{i}=\tau_{i}^{-1}\left(\tilde{\omega}_{1}\right), 0 \leqq i \leqq 2 n-3$ and $\chi_{n-1}^{\prime}=\tau_{n-1}^{\prime-1}\left(\tilde{\omega}_{1}\right)$. Then there exist sections $f_{i} \in \mathrm{H}^{0}\left(\mathrm{X}\left(w_{i}\right)_{r}, \mathrm{~L}\left(\chi_{i}\right)_{\left.\mathrm{X}_{\left(w_{i}\right)_{r}}\right)}\right.$ and $f_{n-1}^{\prime} \in \mathrm{H}^{0}\left(\mathrm{X}\left(w_{n-1}^{\prime}\right)_{r},\left.\mathrm{~L}\left(\chi_{n-1}^{\prime}\right)\right|_{\mathrm{X}\left(w_{n-1}^{\prime}\right)_{r}}\right)$ such that (set-theoretically) the set of zeros of
(i) $f_{i}$ in $\mathrm{X}\left(w_{i}\right)_{r}$ is $\mathrm{X}\left(w_{i+1}\right)_{r} \quad$ if $0 \leqq i \leqq n-3$ or $n-1 \leqq i \leqq 2 n-3$.
(ii) $\quad f_{n-2}$ in $\mathrm{X}\left(w_{n-2}\right)_{\mathrm{r}}$ is $\mathrm{X}\left(w_{n-1}\right)_{r} \cup \mathrm{X}\left(w_{n-1}^{\prime}\right)_{r}$.
(iii)

$$
f_{n-1}^{\prime} \quad \text { in } \mathrm{X}\left(w_{n-1}^{\prime}\right)_{r} \text { is } \mathrm{X}\left(w_{n}\right)_{r}
$$

Proof. - Similar to that of Proposition B. 5.
5. The family of characters $\left\{\chi_{i}, \chi_{n-1}^{\prime}\right\}$.

Proposition D. 6. - The characters

$$
\chi_{i}\left(=\tau_{i}^{-1}\left(\tilde{\omega}_{1}\right)\right), \quad 0 \leqq i \leqq 2 n-3 \quad \text { and } \quad \chi_{n-1}^{\prime}\left(=\tau_{n-1}^{\prime-1}\left(\tilde{\omega}_{1}\right)\right)
$$

are given by $\chi_{0}=\tilde{\omega}_{1}$ and

$$
\begin{gather*}
\chi_{i}=\tilde{\omega}_{i+1}-\tilde{\omega}_{i} \quad \text { for } \quad 1 \leqq i \leqq n-3 ;  \tag{a}\\
\chi_{n-2}=-\chi_{n}=\tilde{\omega}_{n}+\tilde{\omega}_{n-1}-\tilde{\omega}_{n-2} ;  \tag{b}\\
\chi_{n-1}=-\chi_{n-1}^{\prime}=\tilde{\omega}_{n-1}-\tilde{\omega}_{n} . \\
\chi_{n+j}=\tilde{\omega}_{n-j-2}-\tilde{\omega}_{n-j-1} \quad \text { for } \quad 1 \leqq j \leqq n-3 . \tag{d}
\end{gather*}
$$

(c)

Proof. - Similar to that of Proposition of B. 6. In this case, recall that the recurrence relations are as follows :

$$
\begin{gathered}
\tau_{i}=\tau_{i-1} s_{i} \quad \text { for } \quad 1 \leqq i \leqq n-2 \quad\left(\tau_{0}=\mathrm{Id}\right) \\
\tau_{n-1}=\tau_{n-2} s_{n} \quad \text { and } \quad \tau_{n-1}^{\prime}=\tau_{n-2} s_{n-1} \\
\tau_{n}=\tau_{n-1} s_{n-1}=\tau_{n-1}^{\prime} s_{n}
\end{gathered}
$$

and

$$
\tau_{n+j}=\tau_{n+j-1} s_{n-j-1} \quad \text { for } \quad 1 \leqq j \leqq n-3
$$

6. Structure of Schubert varieties in $\mathrm{P} \backslash \mathrm{G}$. - For the purpose of this section, we take $\mathrm{G}=\mathrm{SO}(2 n)$, called the (even) Orthogonal group in $2 n$ variables (cf. [2], [23] or [25]). Recall that SO (2n) is realised as a subgroup of GL ( $2 n$ ) as follows : let V be a vector space of dimension $2 n$ over the ground field $k$. With respect to a basis $e_{1}, \ldots, e_{2 n}$ of V , write any point $v \in \mathrm{~V}$ as $v=\left(x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{n}\right)$. Let $\mathrm{Q}=\mathrm{Q}_{n}$ be the quadratic form on V defined by $\mathrm{Q}(v)=x_{1} y_{n}+\ldots+x_{n} y_{n}$.

Let $\mathrm{O}(2 n)$ be the subgroup of $\mathrm{GL}(2 n)$ which leaves the quadratic form Q invariant i.e.

$$
\mathrm{O}(2 n)=\{\mathrm{A} \in \mathrm{GL}(2 n) / \mathrm{Q}(\mathrm{~A} v)=\mathrm{Q}(v) \text { for all } v \in \mathrm{~V}\}
$$

Then SO ( $2 n$ ) is the connected component through the identity element of $\mathrm{O}(2 n)$. Recall (cf. [25]) that we have

$$
\mathrm{SO}(2 n)=\left\{\begin{array}{c}
\mathrm{O}(2 n) \cap \mathrm{SL}(2 n) \quad \text { if char } k \neq 2, \\
\text { ker of Dick : } \mathrm{O}(2 n) \rightarrow \mathbf{Z} / 2 \mathbf{Z}, \text { otherwise } .
\end{array}\right.
$$

[^5]For this imbedding SO $(2 n) \varsigma \mathrm{GL}(2 n)$, the subgroup T (resp. B) of $\mathrm{SO}(2 n)$ consisting of the diagonal (resp. upper triangular) matrices is a maximal torus (resp. Borel subgroup). Fixing these, it is easy to check that $P=P_{\hat{\alpha}_{1}}$ is precisely the subgroup of SO ( $2 n$ ) consisting of the set of matrices of the form

$$
\left(\begin{array}{cccc}
* & * & \cdots & * \\
0 & * & \cdots & * \\
0 & * & \cdots & * \\
0 & 0 & \ldots & 0
\end{array}\right)
$$

Let $\mathrm{P}^{\prime}$ be the (maximal) parabolic subgroup of GL $(2 n)$ consisting of the matrices of the form

$$
\left(\begin{array}{llll}
* & * & \cdots & * \\
0 & * & \cdots & * \\
0 & * & \cdots & *
\end{array}\right)
$$

It is seen easily that $\mathrm{P}=\mathrm{SO}(2 n) \cap \mathrm{P}^{\prime}$ (as schemes).
As usual identifying $P^{\prime} \backslash G L(2 n)$ canonically with $\mathbf{P}(\mathrm{V})$, we see easily that the canonical closed immersion $P \backslash G G P^{\prime} \backslash G L(2 n)=\mathbf{P}(V)$ identifies $P \backslash G$ with the quadratic $Q=0$. Notice that the points on $P \backslash G$ fixed by the maximal torus $T$ are the points $(0, \ldots, 0, \stackrel{i}{1}, 0, \ldots, 0), 1$ at the $i$-th place, $i=1, \ldots, 2 n$.

Let $\mathrm{Y}_{0}, \ldots, \mathrm{Y}_{n-1}, \mathrm{Y}_{n-1}^{\prime}, \mathrm{Y}_{n}, \ldots, \mathrm{Y}_{2 n-2}$ denote the Schubert varieties inP $\backslash \mathrm{G}$. Then in a manner similar to the case of type $\mathbf{B}_{n}$, we find easily the following :

$$
\begin{aligned}
& \mathrm{Y}_{0}=\left\{\mathrm{Q}_{n}=x_{1} y_{n}+\ldots+x_{n} y_{1}=0 \text { in } \mathbf{P}=\mathbf{P}(\mathrm{V})\right\} \\
& \mathrm{Y}_{1}=\left\{\mathrm{Q}_{n-1}=x_{2} y_{n-1}+\ldots+x_{n} y_{1}=0 \text { and } x_{1}=0 \text { in } \mathbf{P}\right\} \\
& \vdots \\
& \mathrm{Y}_{n-2}=\left\{\mathrm{Q}_{2}=x_{n-1} y_{2}+x_{n} y_{1}=0 \text { and } x_{1}=\ldots=x_{n-2}=0 \text { in } \mathbf{P}\right\} \\
& \mathrm{Y}_{n-1} \cup \mathrm{Y}_{n-1}^{\prime}=\left\{\mathrm{Q}_{1}=x_{n} y_{1}=0 \text { and } x_{1}=\ldots=x_{n-1}=0 \text { in } \mathbf{P}\right\} \\
& \quad=\left\{x_{1}=\ldots=x_{n}=0\right\} \cup\left\{x_{1}=\ldots=x_{n-1}=y_{1}=0\right\} \\
& \\
& \mathrm{Y}_{n}=\mathrm{Y}_{n-1} \cap \mathrm{Y}_{n-1}^{\prime}=\left\{x_{1}=\ldots=x_{n}=y_{1}=0\right\} \\
& \mathrm{Y}_{2 n-2}=\left\{x_{1}=\ldots=x_{n}=y_{1}=\ldots=y_{n-1}=0\right\}=\text { the } p t\{(0, \ldots, 0,1)\} .
\end{aligned}
$$

Thus we find (as in the case of type $\mathbf{B}_{n}$ ) that
(i) $\mathrm{Y}_{0}, \mathrm{Y}_{n-1}^{\prime}$ and $\mathrm{Y}_{n+j},-1 \leqq j \leqq n-2$, are non-singular.
(ii) $\mathrm{Y}_{i}, 1 \leqq i \leqq n-2$ are (generalised) cones in $\mathbf{P}$ over the quadrics $\mathrm{Q}_{n-i}$ which lie in the lower dimensional projective spaces $\mathbf{P}^{2 n-1-2 i}$ with coordinates $\left(x_{i+1}, \ldots, x_{n}, y_{n}, \ldots, y_{n-i}\right)$, and are in particular normal.
(iii) $\mathrm{Y}_{n-1}$ (resp. $\mathrm{Y}_{n-1}^{\prime}$ ) is not a Cartier divisor in $\mathrm{Y}_{n-2}$, however, $\mathrm{Y}_{n-1} \cup \mathrm{Y}_{n-1}^{\prime}$ is a Cartier divisor in $\mathrm{Y}_{n-2}$.
(iv) The union $Y_{n-1} \cup Y_{n-1}^{\prime}$ and the intersection $Y_{n-1} \cap Y_{n-1}^{\prime}$ are scheme-theoretic.
7. The ideal sheaf $\mathrm{X}\left(w_{i}\right)_{r}$ in $\mathrm{X}\left(w_{i-1}\right)_{r}$.

Proposition D. 7. - The sheaf of ideals defining

$$
\begin{align*}
\mathrm{X}\left(w_{i}\right)_{r} & \text { in } \mathrm{X}\left(w_{i-1}\right)_{r} \tag{i}
\end{align*} \text { is }\left.\quad \mathrm{L}\left(-\chi_{i-1}\right)\right|_{\mathrm{X}\left(w_{i-1}\right)_{r}} .
$$

$$
\begin{equation*}
\mathrm{X}\left(w_{n-1}\right)_{r} \cup \mathrm{X}\left(w_{n-1}^{\prime}\right)_{r} \quad \text { in } \mathrm{X}\left(w_{n-2}\right)_{r} \quad \text { is }\left.\quad \mathrm{L}\left(-\chi_{n-2}\right)\right|_{\mathrm{X}\left(w_{n-2}\right)_{r}} \tag{ii}
\end{equation*}
$$

(i.e., the equalities in Propositions D. 4 and D. 5 are scheme-theoretic).

Proof. - Similar to that of Proposition B. 7.

## 8. Vanishing Theorem.

Theorem D. 8. - For every line bundle $\mathrm{L}(\chi)$ on $\mathrm{G} / \mathrm{B}$ belonging to the dominant chamber, we have

$$
\mathrm{H}^{p}\left(\mathrm{X}\left(w_{i}\right)_{r},\left.\mathrm{~L}(\chi)\right|_{\mathrm{X}\left(w_{i}\right) r}\right)=0 \text { for all } p>0
$$

and $i=0, \ldots, 2 n-2\left[\right.$ a similar assertion for $\left.\mathrm{X}\left(w_{n-1}^{\prime}\right)_{r}\right]$. In particular for $i=0$, we have

$$
\mathrm{H}^{p}(\mathrm{G} / \mathrm{B}, \mathrm{~L}(\chi))=0 \text { for all } p>0
$$

Proof. - Write $\mathrm{X}_{i}=\mathrm{X}\left(w_{i}\right)_{r}, 0 \leqq i \leqq 2 n-2$ and $\mathrm{X}_{n-1}^{\prime}=\mathrm{X}\left(w_{n-1}^{\prime}\right)_{\mathrm{r}}$. Proceeding as in the proof of Theorem A. 8, by increasing induction on the integer ( $\chi, \alpha_{n-j-2}^{*}$ ) for $i=n+j, 0 \leqq j \leqq n-3$, we find that the theorem is true for $\mathrm{X}_{i}, n \leqq i \leqq 2 n-2$; similarly, by increasing induction on $\left(\chi, \alpha_{n-1}^{*}\right)$ [resp. $\left.\left(\chi, \alpha_{n}^{*}\right)\right]$, we find that the theorem is true for $\mathbf{X}_{n-1}$ (resp. $\mathrm{X}_{n-1}^{\prime}$ ). Assuming that we have proved the theorem for $\mathrm{X}_{n-2}$, again by the same procedure [now the induction being on ( $\chi, \alpha_{i+1}^{*}$ ) we find that the theorem is true for $\left.\mathrm{X}_{i}, 0 \leqq i \leqq n-3\right]$. Thus we have only to prove the theorem for $\mathrm{X}_{n-2}$, remembering that the theorem is true in particular for $\mathrm{X}_{n}, \mathrm{X}_{n-1}$ and $\mathrm{X}_{n-1}^{\prime}$.
Proof of the theorem for $\mathrm{X}_{n-2}$. - Let $\mathrm{Z}=\mathrm{X}_{n-1} \cup \mathrm{X}_{n-1}^{\prime}$. By Proposition D. 7, we know that Z is the closed subscheme of $\mathrm{X}_{n-2}$ obtained as the scheme-theoretic union of $X_{n-1}$ and $X_{n-1}^{\prime}$ patched along the subscheme $X_{n}=X_{n-1} \cap X_{n-1}^{\prime}$. Now we prove

$$
\begin{equation*}
\mathrm{H}^{p}\left(\mathrm{Z},\left.\mathrm{~L}(\chi)\right|_{\mathrm{z}}\right)=0 \quad \text { for all } p>0 \quad \text { (and } \chi \geqq 0 \text { ). } \tag{I}
\end{equation*}
$$

Consider the exact sequence

$$
0 \rightarrow \mathcal{O}_{\mathbf{z}} \rightarrow \mathcal{O}_{\mathbf{X}_{n-1}} \oplus \mathcal{O}_{\mathbf{X}_{n-1}^{\prime}} \rightarrow \mathcal{O}_{\mathbf{x}_{n}} \rightarrow 0
$$

This gives the exact sequence

$$
\left.\left.\left.\left.0 \rightarrow \mathrm{~L}(\chi)\right|_{\mathrm{Z}} \rightarrow \mathrm{~L}(\chi)\right|_{\mathrm{x}_{n-1}} \oplus \mathrm{~L}(\chi)\right|_{\mathrm{X}_{n-1}^{\prime}} \rightarrow \mathrm{L}(\chi)\right|_{\mathrm{X}_{n}} \rightarrow 0
$$

$$
4^{\text {e }} \text { SÉrie }- \text { tome } 7-1974-\text { No } 1
$$

and hence we get the exact sequence

$$
\begin{aligned}
(\star) \quad 0 & \rightarrow \mathrm{H}^{0}(\mathrm{Z}, \mathrm{~L}(\chi)) \rightarrow \mathrm{H}^{0}\left(\mathrm{X}_{n-1}, \mathrm{~L}(\chi)\right) \oplus \mathrm{H}^{0}\left(\mathrm{X}_{n-1}^{\prime}, \mathrm{L}(\chi)\right) \xrightarrow{\lambda} \mathrm{H}^{0}\left(\mathrm{X}_{n}, \mathrm{~L}(\chi)\right) \\
& \rightarrow \mathrm{H}^{p}(\mathrm{Z}, \mathrm{~L}(\chi)) \rightarrow \mathrm{H}^{p}\left(\mathrm{X}_{n-1}, \mathrm{~L}(\chi)\right) \oplus \mathrm{H}^{p}\left(\mathrm{X}_{n-1}^{\prime}, \mathrm{L}(\chi)\right) \rightarrow \mathrm{H}^{p}\left(\mathrm{X}_{n}, \mathrm{~L}(\chi)\right) \rightarrow .
\end{aligned}
$$

Since the theorem is true for $\mathrm{X}_{n-1}, \mathrm{X}_{n-1}^{\prime}$ and $\mathrm{X}_{n},(\boldsymbol{\star})$ implies that $\mathrm{H}^{p}(\mathrm{Z}, \mathrm{L}(\chi))=0$ for all $p \geqq 2$. To prove $\mathrm{H}^{1}(\mathrm{Z}, \mathrm{L}(\chi))=0$, it suffices to prove the

Claim. $-\lambda$ is surjective.
Recall that we have the exact sequence [given by the divisor $X_{n}$ in $X_{n-1}$ whose ideal sheaf is isomorphic to $\left.\mathrm{L}\left(-\chi_{n-1}\right)\right|_{\mathrm{X}_{n-1}}, c f$. Proposition D. 7] :

$$
\left.0 \rightarrow \mathrm{~L}\left(-\chi_{n-1}\right)\right|_{\mathrm{X}_{n-1}} \rightarrow \mathcal{O}_{\mathrm{X}_{n-1}} \rightarrow \mathcal{O}_{\mathrm{X}_{n}} \rightarrow 0 .
$$

Tensoring by $\mathrm{L}(\chi)$, we get the exact sequence

$$
\left.\left.\left.0 \rightarrow \mathrm{~L}\left(\chi-\chi_{n-1}\right)\right|_{\mathrm{X}_{n-1}} \rightarrow \mathrm{~L}(\chi)\right|_{\mathrm{X}_{n-1}} \rightarrow \mathrm{~L}(\chi)\right|_{\mathrm{X}_{n}} \rightarrow 0
$$

and hence the exact sequence

$$
\mathrm{H}^{0}\left(\mathrm{X}_{n-1}, \mathrm{~L}(\chi)\right) \xrightarrow{\lambda_{1}} \mathrm{H}^{0}\left(\mathrm{X}_{n}, \mathrm{~L}(\chi)\right) \rightarrow \mathrm{H}^{1}\left(\mathrm{X}_{n-1}, \mathrm{~L}\left(\chi^{\prime}\right)\right),
$$

where

$$
\chi^{\prime}=\chi-\chi_{n-1}=\chi-\tilde{\omega}_{n-1}+\tilde{\omega}_{n} \quad(c f . \text { Proposition D.6). }
$$

Notice that

$$
\left(\chi^{\prime}, \alpha_{n-1}^{*}\right)=\left(\chi, \alpha_{n-1}^{*}\right)-1
$$

and

$$
\left(\chi^{\prime}, \alpha_{j}^{*}\right) \geqq\left(\chi, \alpha_{j}^{*}\right) \quad \text { for } \quad j \neq n-1 .
$$

Hence by Remark D. 3 (ii) and Corollary 1.15, and the theorem being true for $X_{n-1}$, we find that $H^{1}\left(X_{n-1}, L\left(\chi^{\prime}\right)\right)=0$. Hence $\lambda_{1}$ is surjective. Similarly, replacing $X_{n-}$ by $\mathrm{X}_{n-1}^{\prime}$ in the above argument, we get that

$$
\mathrm{H}^{0}\left(\mathrm{X}_{n-1}^{\prime}, \mathrm{L}(\chi)\right) \xrightarrow{\lambda_{1}^{\prime}} \mathrm{H}^{0}\left(\mathrm{X}_{n}, \mathrm{~L}(\chi)\right)
$$

is surjective. But now the claim is obvious since $\lambda=\lambda_{1}-\lambda_{1}^{\prime}$.
(II) We now conclude the proof of the theorem as follows :

By Proposition D. 7, the ideal sheaf of Z in $\mathrm{X}_{n-2}$ is $\left.\approx \mathrm{L}\left(-\chi_{n-2}\right)\right|_{\mathrm{X}_{n-2}}$ and so we have the exact sequence

$$
\left.0 \rightarrow \mathrm{~L}\left(-\chi_{n-2}\right)\right|_{\mathrm{X}_{n-2}} \rightarrow \mathcal{O}_{\mathrm{X}_{n-2}} \rightarrow \mathcal{O}_{\mathrm{Z}} \rightarrow 0 .
$$

Tensoring by $\mathrm{L}(\chi)$, we get the exact sequence

$$
\left.\left.\left.0 \rightarrow \mathrm{~L}\left(\chi-\chi_{n-2}\right)\right|_{\mathrm{x}_{n-2}} \rightarrow \mathrm{~L}(\chi)\right|_{\mathrm{x}_{n-2}} \rightarrow \mathrm{~L}(\chi)\right|_{\mathrm{z}} \rightarrow 0 .
$$

This gives the exact sequence

$$
\rightarrow \mathrm{H}^{p}\left(\mathrm{X}_{n-2}, \mathrm{~L}\left(\chi^{\prime}\right)\right) \rightarrow \mathrm{H}^{p}\left(\mathrm{X}_{n-2}, \mathrm{~L}(\chi)\right) \rightarrow \mathrm{H}^{p}(\mathrm{Z}, \mathrm{~L}(\chi)) \rightarrow,
$$

where

$$
\chi^{\prime}=\chi-\chi_{n-2}=\chi+\tilde{\omega}_{n-2}-\tilde{\omega}_{n-1}-\tilde{\omega}_{n}
$$

By (I), this reduces to the exact sequences

$$
\mathrm{H}^{p}\left(\mathrm{X}_{n-2}, \mathrm{~L}\left(\chi^{\prime}\right)\right) \rightarrow \mathrm{H}^{p}\left(\mathrm{X}_{n-2}, \mathrm{~L}(\chi)\right) \rightarrow 0
$$

for all $p \geqq 1$. We prove the result by induction on $\left(\chi, \alpha_{n-1}^{*}\right)$ or $\left(\chi, \alpha_{n}^{*}\right)$. First notice that
(i)

$$
\begin{aligned}
\left(\chi^{\prime}, \alpha_{n-1}^{*}\right) & =\left(\chi, \alpha_{n-1}^{*}\right)-1 \\
\left(\chi^{\prime}, \alpha_{n}^{*}\right) & =\left(\chi, \alpha_{n}^{*}\right)-1
\end{aligned}
$$

and
(ii)

$$
\left(\chi^{\prime}, \alpha_{j}^{*}\right) \geqq\left(\chi, \alpha_{j}^{*}\right) \quad \text { for } \quad j \neq n-1 \quad \text { or } \quad n
$$

Suppose one of $\left(\chi, \alpha_{n-1}^{*}\right)$ or $\left(\chi, \alpha_{n}^{*}\right)$ is 0 , say $\left(\chi, \alpha_{n-1}^{*}\right)=0$. Then by Remark D. 3 (ii) and Corollary $1.15, \mathrm{H}^{p}\left(\mathrm{X}_{n-2}, \mathrm{~L}\left(\chi^{\prime}\right)\right)=0$ for all $p \geqq 0$ and so $\mathrm{H}^{p}\left(\mathrm{X}_{n-2}, \mathrm{~L}(\chi)\right)=0$ as required. So we can assume $\left(\chi, \alpha_{n-1}^{*}\right)>0$ and $\left(\chi, \alpha_{n}^{*}\right)>0$. Hence $\chi^{\prime} \geqq 0$. Now proceeding by induction on either of $\left(\chi, \alpha_{n-1}^{*}\right)$ and $\left(\chi, \alpha_{n}^{*}\right)$, we get the result.

This completes the proof of the theorem.

## G. Type $\mathbf{G}_{2}$

1. Numerical data. - Recall the following facts for a group $G$ of type $\mathbf{G}_{2}$.

Dynkin diagram :

The Cartan numbers

$$
n_{i j}=\left(\alpha_{i}, \alpha_{j}^{*}\right)=2\left(\alpha_{i}, \alpha_{j}\right) /\left(\alpha_{j}, \alpha_{j}\right)
$$

are given by the matrix

$$
\left(n_{i j}\right)=\left(\begin{array}{cc}
2 & -1 \\
-3 & 2
\end{array}\right)
$$

The number of roots $=12$.
The order of the Weyl group $\mathrm{W}\left(=\mathrm{W}\left(\mathbf{G}_{2}\right)\right)$ of $\mathrm{G}=12$.
2. A REDUCED EXPRESSION FOR $w_{0}$.

Proposition G. 1. - A reduced expression for the element $w_{0} \in \mathrm{~W}$ (of largest length) is given by

$$
w_{0}=s_{2} s_{1} s_{2} s_{1} s_{2} s_{1}
$$

Proof. - Write $u=s_{2} s_{1} s_{2} s_{1} s_{2} s_{1}$. We have $l(u) \leqq 6$. It is trivial to check that $u\left(\alpha_{1}\right)=-\alpha_{1}$ and $u\left(\alpha_{2}\right)=-\alpha_{2}$ (i.e., $u=-\mathrm{Id}$ ). Hence by Proposition 1.1 (iii), we get that $u\left(=w_{0}\right)$ is the element of largest length in W . But $l\left(w_{0}\right)=6=1 / 2$ number of roots and hence the result.

$$
4^{\text {e }} \text { série - TOME } 7-1974-\mathrm{N}^{\circ} 1
$$

3. The Parabolic subgroup $P\left(=P_{\hat{\alpha}_{1}}\right)$. - Since the rank of $G$ is 2 , it is clear that $P=P_{\hat{\alpha}_{1}}=P_{\alpha_{2}}$ (i.e., minimal parabolic subgroups $P_{\alpha_{1}}$ and $P_{\alpha_{2}}$ of $G$ are also the maximal ones). We have $\mathrm{W}_{\mathrm{P}}=\left\{1, s_{2}\right\}$ and the number of Schubert varieties in $\mathrm{P} \backslash \mathrm{G}$ is $\left[\mathrm{W}: \mathrm{W}_{\mathrm{P}}\right]=6$.
4. The family of closed Bruhat cells $\left\{\mathbf{X}\left(w_{i}\right)\right\}$. - Define the sequences $\left\{\tau_{i}\right\}$ and $\left\{w_{i}\right\}$ of elements in W as follows:

$$
\begin{array}{ll}
\left\{\tau_{i}\right\}: & \tau_{0}=\mathrm{Id}, \quad \tau_{1}=s_{1}, \quad \tau_{2}=s_{1} s_{2}, \quad \tau_{3}=s_{1} s_{2} s_{1} \\
& \tau_{4}=s_{1} s_{2} s_{1} s_{2} \quad \text { and } \tau_{5}=s_{1} s_{2} s_{1} s_{2} s_{1} \\
\left\{w_{i}\right\}: & w_{i}=w_{0} \tau_{i}, \quad 0 \leqq i \leqq 5
\end{array}
$$

Proposition G. 2.
(i) $\mathrm{G}=\mathrm{X}\left(w_{0}\right) \supset \mathrm{X}\left(w_{1}\right) \supset \ldots \supset \mathrm{X}\left(w_{5}\right)=\mathrm{P}$.
(ii) Each $\mathrm{X}\left(w_{i}\right)$ is of codimension 1 in $\mathrm{X}\left(w_{i-1}\right)$.
(iii) $\mathrm{X}\left(w_{i}\right)$ are the inverse images (under the natural morphism $\left.\mathrm{G} \rightarrow \mathrm{P} \backslash \mathrm{G}\right)$ of the Schubert varieties in $\mathrm{P} \backslash \mathrm{G}$.

Proof. - Similar to that of Proposition A. $\dot{2}$.
Remark G.3.- We are

$$
\begin{equation*}
\mathrm{X}\left(w_{i}\right)=\mathrm{P} w_{i} \mathrm{~B} \cup \mathrm{X}\left(w_{i+1}\right), \quad 0 \leqq i \leqq 4 \tag{i}
\end{equation*}
$$

the union being set-theoretic and disjoint.
(ii) $\mathrm{X}\left(w_{i}\right)$ is stable for multiplication on the right by the parabolic subgroups $\mathrm{P}_{\alpha_{1}}$ or $\mathrm{P}_{\alpha_{2}}$ according as $i$ is even or odd, $0 \leqq i \leqq 4$.

Proof. - Similar to that of Remark A. 3.
Proposition G. 4. - We have (set-theoretically) :

$$
\mathrm{X}\left(w_{i}\right) \cap \mathrm{X}\left(w_{1}\right) \tau_{i}=\mathrm{X}\left(w_{i+1}\right), \quad 0 \leqq i \leqq 4
$$

(where $\tau_{i}=w_{0} w_{i}$ ).
Proof. - Similar to that of Proposition A. 4.
Proposition G. 5. - Let $\chi_{i}=\tau_{i}^{-1}\left(\tilde{\omega}_{1}\right), 0 \leqq i \leqq 4$. For each $i$ there exists an element $f_{i} \in \mathbf{H}^{0}\left(\mathrm{X}\left(w_{i}\right)_{r},\left.\mathrm{~L}\left(\chi_{i}\right)\right|_{\mathrm{X}\left(w_{i}\right)_{r}}\right)$ such that (set-theoretically) the set of zeros of $f_{i}$ in $\mathrm{X}\left(w_{i}\right)_{r}$ is $\mathrm{X}\left(w_{i+1}\right)_{r}$.

Proof. - Same as in Proposition B. 5.
5. The family of characters $\left\{\chi_{i}\right\}$.

Proposition G. 6. - The characters $\chi_{i}\left(=\tau_{i}^{-1}\left(\tilde{\omega}_{1}\right)\right), 0 \leqq i \leqq 4$, are given by $\chi_{0}=\tilde{\omega}_{1}$ and

$$
\chi_{1}=-\chi_{4}=\tilde{\omega}_{2}-\tilde{\omega}_{1} \quad \text { and } \quad \chi_{2}=-\chi_{3}=2 \tilde{\omega}_{1}-\tilde{\omega}_{2}
$$

ANNALES SCIENTIFIQUES DE L'ÉCOLE NORMALE SUPÉRIEURE

Proof. - Straight forward verification.
6. Structure of Schubert varieties in P\G. - Recall that there exists only one connected semi-simple linear algebraic group $G$ upto isomorphism which is of type $\mathbf{G}_{2}$ and that we have a faithful representation of G in GL (7) which factors through $\mathrm{G}^{\prime}=\mathrm{SO}(7)$ (cf. [7], [9], [15], etc.). We can choose a maximal torus $\mathrm{T}^{\prime}$ (resp. a Borel subgroup $B^{\prime} \supset T^{\prime}$ ) in $G^{\prime}$ such that the following facts hold, namely
(i) $\mathrm{T}=\mathrm{G} \cap \mathrm{T}^{\prime}$ (resp. $\mathrm{B}=\mathrm{G} \cap \mathrm{B}^{\prime}$ ) (as schemes) is a maximal torus (resp. a Borel subgroup) in G.
(ii) If $\alpha_{1}^{\prime}, \alpha_{2}^{\prime}$ and $\alpha_{3}^{\prime}$ are the simple roots of $\mathrm{G}^{\prime}$ relative to $\mathrm{T}^{\prime}$ and $\mathrm{B}^{\prime}$ with Dynkin diagram

then $\alpha_{1}$ and $\alpha_{2}$ where $\alpha_{1}=\left.\alpha_{1}^{\prime}\right|_{\mathrm{T}}=\left.\alpha_{3}^{\prime}\right|_{\mathrm{T}}$ and $\alpha_{2}=\left.\alpha_{2}^{\prime}\right|_{\mathrm{T}}$ are the simple roots of G relative to T and B with Dynkin diagram

and further.
(iii) $\mathrm{P}=\mathrm{G} \cap \mathrm{P}^{\prime}$ (as schemes) where $\mathrm{P}^{\prime}=\mathrm{P}_{\hat{\alpha}_{1}^{\prime}}$ in $\mathrm{G}^{\prime}$ and $\mathrm{P}=\mathrm{P}_{\hat{\alpha}_{1}}$ in G .

Consequently, we have a closed immersion $P \backslash G G P^{\prime} \backslash \mathrm{G}^{\prime}$. But this is an isomorphism because $\operatorname{dim} \mathrm{P} \backslash \mathrm{G}=5=\operatorname{dim} \mathrm{P}^{\prime} \backslash \mathrm{G}^{\prime}$, in other words, $\mathrm{P} \backslash \mathrm{G}$ is a five dimensional quadric and hence from the section 6 of Type $\mathrm{B}_{n}$ for $n=3$, we get to know the structure of Schubert varieties in $P \backslash G$.
7. The ideal sheaves of $\mathrm{X}\left(w_{i}\right)_{r}$ in $\mathrm{X}\left(w_{i-1}\right)_{r}$ are determined exactly as in the case of Type $B_{3}$.

## 8. Vanishing Theorem.

Theorem G.11. - For every line bundle $\mathrm{L}(\chi)$ on $\mathrm{G} / \mathrm{B}$ belonging to the dominant chamber, we have

$$
\mathrm{H}^{p}\left(\mathrm{X}\left(w_{i}\right)_{r},\left.\mathrm{~L}(\chi)\right|_{\mathrm{X}\left(w_{i}\right) r}\right)=0 \quad \text { for } \quad p>0
$$

and $i=0, \ldots, 5$. In particular for $i=0$, we have

$$
\mathrm{H}^{p}(\mathrm{G} / \mathrm{B}, \mathrm{~L}(\chi))=0 \text { for all } p>0 .
$$

Proof. - Exactly same as that of Theorem B. 11 for $n=3$. However, in carrying out the details in this case one must use the values of the characters $\chi_{i}, 0 \leqq i \leqq 4$, as given by Proposition G. 6 (but not as in Proposition B. 6 for $n=3$ ). While proving the theorem for $\mathrm{X}_{2}=\mathrm{X}\left(w_{2}\right)_{r}$, the proof of (I) goes verbatum and the proof is completed by proceeding by increasing induction on ( $\chi, \alpha_{1}^{*}$ ).
