# DUALITY OF THE SPACES OF LINEAR FUNGTIONALS ON DUAL VEGTOR SPACES; 

By H. S. Allen.

1. Dual linear vector spaces have been studied by Dieudonne [1] and Jacobson [2] and self-dual spaces by Rickart [3], [4]. In this paper it is established that the spaces of linear functionals on dual spaces are dual spaces and that the space of linear functionals on a self-dual space is self-dual and of the same type (symmetric or unitary), assuming that the characteristic of the sfield of scalars is not two.
2. Let $E$ and $F$ be left and right linear vector spaces over a sfield $K$. Suppose there is a bilinear functional $(x, y)$ defined on $\mathrm{E} \times \mathrm{F}$ to K which is non-degenerate, i. e. $(x, y)=0$ for all $x$ (resp. all $y$ ) implies $y=0$ (resp. $x=0$ ) : then E and F are said to be dual spaces relative to $(x, y)$. Let $\mathrm{F}^{*}$ and $\mathrm{E}^{*}$ be the left and right $K$-spaces whose elements are the linear functionals on $F$ and $E$, the algebraic operations of addition and scalar multiplication being defined as in Bourbaki [5]. If $x \in \mathrm{E}$ and $f \in \mathrm{E}^{*}$ we write $f(x)=\langle x, f\rangle$ : the spaces E and $\mathrm{E}^{*}$ are dual spaces relative to $\langle\boldsymbol{x}, f\rangle$. If $y \in \mathrm{~F}$ and $g \in \mathrm{~F}^{*}$ we write $g(y)=\langle\boldsymbol{g}, \boldsymbol{y}\rangle$ : the spaces $\mathrm{F}^{*}$ and F are dual spaces relative to $\langle g, y\rangle$. We prove the following theorem.

Theorbm 1.-If the characteristic of $\mathrm{K} \neq 2$, then $\mathrm{F}^{*}$ and $\mathrm{E}^{*}$ are dual spaces.
If $y_{1} \in \mathrm{~F}$, the functional $f_{1}$ defined on E by $\left\langle x, f_{1}\right\rangle=\left(x, y_{1}\right)$ belongs to $\mathrm{E}^{*}$ and the mapping $y_{1} \rightarrow f_{1}$ is an isomorphic mapping of $F$ on a subspace $M$ of $\mathrm{E}^{*}$. We shall denote this correspondence by writing $f_{1}^{\alpha}=y_{1}$. Similarly E is isomorphic to a subspace N of $\mathrm{F}^{*}$ under a mapping $x_{1} \rightarrow g_{1}$ where $\left\langle g_{1}, y\right\rangle=\left(x_{1}, y\right)$ and we write $g_{1}^{\beta}=x_{1}$.

There is a subspace $Q$ of $E^{*}$ which is the algebraic complement of $M$ (i. e. $E^{*}$ is the direct sum $M+Q$ ) and a subspace $P$ of $F^{*}$ which is the algebraic complement of $N$. Suppose $g \in \mathrm{~F}^{*}$ and $f \in \mathrm{E}^{*}$. Let $g=g_{1}+g_{2}$ where $g_{1} \in \mathbf{N}, g_{2} \in \mathrm{P}$ and $f=f_{1}+f_{2}$ where $f_{1} \in \mathrm{M}, f_{3} \in \mathrm{Q}$. If $g_{1}^{\beta}=x_{1}$ and $f_{1}^{x}=y_{1}$ we define

$$
\{g, f\}=\frac{1}{2}\left[\left\langle x_{1}, f\right\rangle+\left\langle g, y_{1}\right\rangle\right] .
$$

It is easily proved that the functional $\{g, f\}$ is bilinear. Suppose $f$ is fixed and $\{g, f\}=\mathrm{o}$ for every $g$. Taking $g_{2}=\mathrm{o}$ we obtain

$$
\left\langle g^{\prime}, y_{1}\right\rangle=\left\langle g_{1}, y_{1}\right\rangle=\left(x_{1}, y_{1}\right)=\left\langle x_{1}, f_{1}\right\rangle \quad \text { and } \quad 0=\left\{g_{1}, f\right\}=\frac{1}{2}\left\langle x_{1}, f+f_{1}\right\rangle
$$

This holds for every $x_{1} \in \mathrm{E}$ and it follows that

$$
f+f_{1}=2 f_{1}+f_{2}=0 .
$$

Hence $2 f_{1}=-f_{2} \in \mathrm{M} \cap Q$ and therefore $f_{1}=0, f_{2}=0$ and $f=0$. Similarly $\{g, f\}=o$ for every $f$ implies $g=o$. It follows that $\mathrm{F}^{*}$ and $\mathrm{E}^{*}$ are dual spaces relative to $\{\boldsymbol{g}, \boldsymbol{f}\}$.
3. A left vector space E over ar sfield K is said to be self-dual if there is an involution $a \rightarrow a^{5}$ in K and a scalar product ( $x, y$ ) defined on $\mathrm{E} \times \mathrm{E}$ to K with the properties (i) $(x, y)$ is linear in $x$ for every $y,(i i)(x, y)=0$ for all $y$ implies $x=0$, (iii) $(y, x)=e(x, y)^{\mathrm{J}}$ where $e= \pm \mathrm{I}$ is a constant independent of $x$ and $y$. A self-dual space is said to be symplectic if every vector is isotropic, i. e. $(x, x)=0$. If there exist non-isotropic vectors in the space, the space is said to be unitary, (Rickart [3], [4]). As before $\mathrm{E}^{*}$ will denote the space of linear functionals on $E$. We prove the following result.

Throrem 2. -If the left vector space $\mathbf{E}$ over a sfield K of characteristic $\neq 2$ is self-dual, then the right K -space $\mathrm{E}^{*}$ is self-dual. The space $\mathrm{E}^{*}$ is symplectic or unitary according as E is symplectic or unitary.

Let $\mathrm{E}_{r}$ be the right K -space whose elements are the elements of E with addition defined as on E and scalar multiplication defined by $x a=a^{d} x(x \in \mathrm{E}, a \in \mathrm{~K})$. Then E and $\mathrm{E}_{r}$ are dual spaces relative to $(x, y)$. The space $\mathrm{E}_{r}$ is isomorphic to a subspace M of $\mathrm{E}^{*}$ : we have $x_{1} \rightarrow \mathrm{X}_{1}$ where $\left\langle x, \mathrm{X}_{1}\right\rangle=\left(x, x_{1}\right)$ and we write $x_{1}=\mathbf{X}_{1}^{\alpha}$. There is a subspace $Q$ of $E^{*}$ which is the algebraic complement of $M$. Suppose $X$ and $Y$ in $E^{*}$. Let $X=X_{1}+X_{2}$, where $X_{1} \in M, X_{2} \in Q$ and $Y=Y_{1}+Y_{2}$ where $Y_{1} \in M, Y_{2} \in Q$. Let $X_{1}^{\alpha}=x_{1}$ and $Y_{1}^{\alpha}=y_{1}$. We define the functional

$$
[\mathrm{X}, \mathrm{Y}]=\frac{1}{2}\left[e\left\langle x_{1}, \mathbf{Y}\right\rangle+\left\langle y_{1}, \mathrm{X}\right\rangle^{\mathrm{J}}\right]
$$

on $\mathrm{E}^{*} \times \mathrm{E}^{*}$ to K . It is easily verified that $[\mathrm{X}, \mathrm{Y}]$ is linear in Y for every fixed $\mathbf{X}$. Suppose $[\mathbf{X}, \mathbf{Y}]=o$ for every $\mathbf{X} . \quad$ Take $\mathbf{X}_{\mathbf{2}}=\mathrm{o}$ and we obtain

$$
\begin{aligned}
o=\left[\mathrm{X}_{1}, \mathrm{Y}\right] & \left.=\frac{1}{2}\left[e\left\langle x_{1}, \mathrm{Y}\right\rangle+\left\langle y_{1}, \mathrm{X}_{1}\right\rangle\right\rangle^{\prime}\right] \\
& =\frac{1}{2}\left[e\left\langle x_{1}, \mathrm{Y}\right\rangle+\left(y_{1}, x_{1}\right)^{\mathrm{j}}\right]=\frac{1}{2} e\left[\left\langle x_{1}, \mathrm{Y}\right\rangle+\left(x_{1}, y_{1}\right)\right] \\
& =\frac{1}{2} e\left[\left\langle x_{1}, \mathbf{Y}\right\rangle+\left\langle x_{1}, \mathrm{Y}_{1}\right\rangle\right]=\frac{1}{2} e\left\langle x_{1}, \mathrm{Y}+\mathrm{Y}_{1}\right\rangle .
\end{aligned}
$$

This holds for every $x_{1} \in E$ and it follows as in theorem 1 that $Y=0$. Evidenthy $[\mathbf{X}, \mathbf{Y}]=e[\mathbf{Y}, \mathbf{X}]^{J}$ and hence $\mathrm{E}^{*}$ is self-dual with respect to $[\mathbf{X}, \mathbf{Y}]$.

If E is unitary we may suppose that $(x, y)$ is hermitian, i. e. $e=\mathrm{I}$ as indi-
cated by Rickart [3], [4]. There is an element $x_{i} \in \mathrm{E}$ such that $\left(x_{1}, x_{1}\right) \neq 0$. If $\mathrm{X}_{1}^{\alpha}=x_{1}$ we have $\left[\mathrm{X}_{1}, \mathrm{X}_{1}\right]=\left(x_{1}, x_{1}\right)$ and $\mathrm{E}^{*}$ is unitary.

If E is symplectic the form $(x, y)$ is skew-hermitian, i. e. $e=-\mathrm{I}$ and K is a field (Rickart). In this case $a^{\boldsymbol{d}}=a$ for every $a \in \mathrm{~K}$ and $\mathrm{E}^{*}$ is symplectic.
