# A NOTE ON THE ONE-DIMENSIONAL SYSTEMS OF FORMAL EQUATIONS 

by Juan ELIAS

$\qquad$
To Joan

## 0. Introduction.

Let $(X, 0)$ be an algebroid singularity defined by the ideal $I \subset$ $\mathbf{k}\left[\left[X_{1}, \ldots, X_{N}\right]\right]$. J. Nash in [ N$]$ proposed to study $(X, 0)$ using the set of $\operatorname{arcs} A_{X}$, i.e. the set of $\alpha . \in \mathbf{k}[[T]]^{N}$ such that $\alpha$. $(0)=0$, and $f(\alpha)=$. for all $f \in I$. Let $A_{X}^{n}$ be the set of $n$-th truncations of $A_{X}: \gamma . \in \mathbf{k}[[T]]^{N}$ belongs to $A_{X}^{n}$ if and only if $\operatorname{deg}\left(\gamma_{i}\right) \leq n$ for all $i=1, \ldots, N$ and there exists $\alpha \in A_{X}$ such that $\alpha$. $-\gamma . \in(T)^{n+1} \mathbf{k}[[T]]^{N}$. Denote by $\pi_{n}: A_{X}^{n} \rightarrow A_{X}^{n-1}$ the truncation map $\pi_{n}\left(\left(\sum_{j=0}^{n} \gamma_{j}^{i} T^{j}\right)_{i=1, \ldots, N}\right)=\left(\sum_{j=0}^{n-1} \gamma_{j}^{i} T^{j}\right)_{i=1, \ldots, N}$, so we have a projective system of sets $\left\{A_{X}^{n}, \pi_{n}\right\}_{n \geq 0}$ and a isomorphism of sets $A_{X} \cong \lim \leftarrow A_{X}^{n}$. Hence a way to study $A_{X}$ is look into $A_{X}^{n}$. In the complex case from the existence of a non-singular model of ( $X, 0$ ) J. Nash deduces that $A_{X}^{n}$ is constructible for all $n$ ( see [ N$],[\mathrm{Le}]$ ), on the other hand J.C. Tougeron ( see [Le]) proves that $A_{X}^{n}$ is constructible from the formal version of the approximation theorem of M. Artin ([A]) due to J. Wavrik ([W1]). In particular from this result one can deduce that there exists a numerical function $\beta: \mathbf{N} \times \mathbf{N} \rightarrow \mathbf{N}$ such that: $\gamma . \in A_{X}^{n}$ if and only if there exists $\tilde{\gamma} . \in \mathbf{k}[[T]]^{N}$ such that $f(\tilde{\gamma}.) \in(T)^{\beta(n)} \mathbf{k}[[T]]^{N}$ for all $f \in I$ and $\gamma .-\tilde{\gamma} . \in(T)^{n+1}$.

[^0]As far as we know only in a few cases we have an explicit determination of $\beta$ : first case is due to J . Wavrik for $X$ reduced plane curve taking non-singular arcs ([W2]), the second one is due to M. Lejeune for hypersurface singularities taking general arcs ([Le]).

In this paper we determine the function $\beta$ in the case of onedimensional singularities $X$, taking non-singular arcs, in terms of the Milnor number associated to $X_{\text {red }}$. See [La] for other results on $\beta$.

The paper is divided in two sections, in the first we give some preliminaires results about contact between curves. In the second one we define the numerical function $\beta$ and we prove the main result of this paper (Theorem 2.1).

Throughout this paper $R$ will be the power series ring $\mathbf{k}\left[\left[X_{1}, \ldots, X_{N}\right]\right]$, where $\mathbf{k}$ is an infinite field. We denote by M the maximal ideal of $R$.

A curve of $\left(\mathbf{k}^{N}, 0\right)=\operatorname{Spec}(R)$ is a one-dimensional, Cohen-Macaulay closed subcheme $X$ of $\left(\mathbf{k}^{N}, 0\right)$, i.e. $X=\operatorname{Spec}(R / I)$ where $I=I(X)$ is a perfect height $\mathrm{N}-1$ ideal of $R$; we put $\mathcal{O}_{\mathcal{X}}=R / I$. A branch is an integral curve.

## 2. Contact of curves.

If $X$ is a reduced curve of $\left(\mathbf{k}^{N}, 0\right)$ then we denote by $\delta(X)$ the dimension over $\mathbf{k}$ of the quotient $\tilde{\mathcal{O}_{\mathcal{X}}} / \mathcal{O}_{\mathcal{X}}$ where $\tilde{\mathcal{O}_{\mathcal{X}}}$ is the integral closure of $\mathcal{O}_{\mathcal{X}}$. If $r$ is the number of branches of $X$ then we define the Milnor number of $X$ by $\mu(X)=2 \delta-r+1$.

Let $X$ be a reduced curve and let $Q$ be an infinitely near point of $X$, see [ECh], [VdW]. It is known that there exists a unique sequence $\{Q\}_{i=0, \ldots, s}$ of infinitely near points of $X$ such that $Q_{0}=0, \ldots, Q_{s}=Q$, and that $Q_{i+1}$ belongs to the first neighbourhood of $Q_{i}$ for $i=0, \ldots, s-1$. We denote by $(X, Q)$ the union of the irreducible components through $Q$ of the proper transform of $X$ by the composition of the blowing-up centered at $Q_{i}$ for $i=0, \ldots, s-1$. We denote by $p_{(X, Q)}(T)=e(X, Q) T-\rho(X, Q)$ the Hilbert polynomial of the local ring $\mathcal{O}_{(X, Q)}$.

For the readers convenience we will summarize some properties of $e(X, Q)$ and $\rho(X, Q)$ that we will use in the paper:
(1) $e(X, Q)-1 \leq \rho(X, Q)$, ([M] Proposition 12.14),
(2) $e(X, Q)=1$ if and only if $\rho(X, Q)=0,([\mathrm{M}]$ Proposition 12.16),
(3) $e(X, Q)=2$ if and only if $\rho(X, Q)=1$, ([M] Proposition 12.17),
(4) $\operatorname{dim}_{\mathbf{k}}\left(R / I+M^{n}\right)=p_{(X, Q)}(n)$ for all $n \geq e(X, Q)-1$, ([K] Theorem 6, or [M] Proposition 12.11).

Let $T(X)$ be the set of infinitely near point $Q$ of $X$ such that its multiplicity $e(X, Q)$ is greater than one. From [Ca] we obtain that

$$
\delta(X)=\sum_{Q \in T(X)} \rho(X, Q)
$$

Let $X, Y$ be curves of $\left(\mathbf{k}^{N}, 0\right)$, without components in common, we denote by $(X . Y)$ the number $\operatorname{dim}_{\mathbf{k}}(R / I(X)+I(Y))([\mathrm{H}])$.

Let $Z_{1}$ be a branch, for every reduced curve $Z_{2}$, such that $Z_{1}$ is not a component of $Z_{2}$, we define $f\left(Z_{1}, Z_{2}\right)$ as the number of non-singular points shared by $Z_{1}$ and $Z_{2}$.

Proposition 1.1. - If $Z_{1}$ is a non-singular branch then

$$
\left(Z_{1} . Z_{2}\right) \leq \mu\left(Z_{2}\right)+f\left(Z_{1}, Z_{2}\right)+1 .
$$

Proof. - From [C] and [M], Proposition 12.16, we deduce

$$
\left(Z_{1} . Z_{2}\right) \leq \sum_{Q \in K}\left(\rho\left(Z_{1} \cup Z_{2}, Q\right)-\rho\left(Z_{2}, Q\right)\right)
$$

where $K$ is the set of infinitely near points shared by $Z_{1}$ and $Z_{2}$.
Since $\left(Z_{i}, Q\right)$ is a curve of $\left(\mathbf{k}^{N}, Q\right) \cong\left(\mathbf{k}^{N}, 0\right)$, we put $\left(Z_{i}, Q\right)=$ $\operatorname{Spec}\left(R / I_{i, Q}\right)$ for $i=1,2$. Consider the projection

$$
\frac{R}{\left(I_{1, Q} \cap I_{2, Q}\right)+M^{n}} \rightarrow \frac{R}{I_{2, Q}+M^{n}}
$$

for all $n \geq e\left(Z_{2}, Q\right)$; from this and [K], Corollary 6, we get

$$
\left(e\left(Z_{2}, Q\right)+1\right) n-\rho\left(Z_{1} \cup Z_{2}, Q\right) \geq e\left(Z_{2}, Q\right) n-\rho\left(Z_{2}, Q\right)
$$

Therefore $\rho\left(Z_{1} \cup Z_{2}, Q\right)-\rho\left(Z_{2}, Q\right) \leq e\left(Z_{2}, Q\right)$, and hence

$$
\begin{equation*}
\left(Z_{1} \cdot Z_{2}\right) \leq \sum_{Q \in K} e\left(Z_{2}, Q\right) \tag{1}
\end{equation*}
$$

Assume that $Z_{2}$ is singular. Since $e\left(Z_{2}, 0\right) \leq \rho\left(Z_{2}, 0\right)+1,[\mathrm{M}]$ Proposition 12.14, and $r \leq e\left(Z_{2}, 0\right)$ we deduce

$$
\begin{equation*}
e\left(Z_{2}, 0\right) \leq\left(2 \rho\left(Z_{2}, 0\right)+1-r\right)+1 \tag{2}
\end{equation*}
$$

Let $K^{*}$ be the set of points belonging to $K$ such that $e\left(Z_{2}, 0\right) \geq 2$. From [M], Proposition 12.17, we obtain that for all $Q \in K^{*}$

$$
\begin{equation*}
e\left(Z_{2}, Q\right) \leq 2 \rho\left(Z_{2}, Q\right) \tag{3}
\end{equation*}
$$

By (2) and (3) we get

$$
\sum_{Q \in K^{*}} e\left(Z_{2}, Q\right) \leq\left(2 \sum_{Q \in K^{*}} \rho\left(Z_{2}, Q\right)+1-r\right)+1
$$

since $\rho\left(Z_{2}, Q\right)=0$ if and only if $e\left(Z_{2}, Q\right)=1$ we have

$$
\sum_{Q \in K^{*}} e\left(Z_{2}, Q\right) \leq \mu\left(Z_{2}\right)+1
$$

Recall that $e\left(Z_{2}, Q\right)=1$ for $Q \in K-K^{*}$, from (1) we obtain the claim.

Proposition 1.2. - Let $Z_{i}=\operatorname{Spec}\left(R / I_{i}\right)$ be curves, $i=1,2$. Assume that $Z_{1}$ is non-singular and $I_{2}+M^{\mu\left(Z_{2}\right)+n+1} \subset I_{1}+M^{\mu\left(Z_{2}\right)+n+1}$. Then we have

$$
n \leq f\left(Z_{1}, Z_{2}\right)
$$

Proof. - From the hypothesis we deduce that

$$
I_{1}+I_{2} \subset I_{1}+I_{2}+M^{\mu\left(Z_{2}\right)+n+1}=I_{1}+M^{\mu\left(Z_{2}\right)+n+1}
$$

so that

$$
\mu\left(Z_{2}\right)+n+1 \leq \operatorname{dim}_{\mathbf{k}}\left(R / I_{1}+M^{\mu\left(Z_{2}\right)+n+1}\right) \leq\left(Z_{1} \cdot Z_{2}\right)
$$

The claim follows from Proposition 1.1.
Corollary 1.3. - If $n \geq 2$ then there exists a non-singular branch $Y$ of $Z_{2}$ such that $n \leq f\left(Z_{1}, Y\right)$.

Proof. - By Proposition 1.2 we get $f\left(Z_{1}, Z_{2}\right) \geq n \geq 2$, so there exists a branch $Y$ of $Z_{2}$ such that $Z_{1}$ and $Y$ share n non-singular infinitely near points. Since a non-singular branch and a singular branch cannot share two non-singular near points, we get that $Y$ is non-singular.

The following result is well known :
Proposition 1.4. - Let $Z_{1}, Z_{2}$ be non-singular branches, for all $n$ the following inequalities are equivalent :
(1) $\left(Z_{1} . Z_{2}\right) \geq n$,
(2) $Z_{1}$ and $Z_{2}$ share $n$ infinitely near points,
(3) for all parametrization of $Z_{1}$ :

$$
Z_{1}:\left\{\begin{array}{l}
X_{1}=t \\
X_{i}=X_{i}(t) \text { for all } i=2, \ldots, N
\end{array}\right.
$$

there exists a parametrization of $Z_{2}$ :

$$
Z_{2}:\left\{\begin{array}{l}
X_{1}=t \\
X_{i}=\tilde{X}_{i}(t) \text { for all } i=2, \ldots, N
\end{array}\right.
$$

such that

$$
X_{i}(t)-\tilde{X}_{i}(t) \equiv 0 \operatorname{modulo}(t)^{n}
$$

for all $i=2, \ldots, N$.

## 2. The function $\beta$.

Definition. - We say that a system of formal equations $\{F=$ $0\}=\left\{F_{1}=0, \ldots, F_{s}=0\right\}, F_{i} \in R$, is one-dimensional if and only if $(F)=\left(F_{1}, \ldots, F_{s}\right)$ is a height $N-1$ ideal of $R$. We denote by $\mathcal{F}$ the set of one-dimensional systems of formal equations.

Let $\{F=0\}$ be a one-dimensional system of formal equations, we define the curve $Z_{F}=\operatorname{Spec}(R / \operatorname{rad}(F))$, and the numbers $\mu(\{F=0\})=$ $\mu\left(Z_{F}\right)$ and $m(\{F=0\})=\operatorname{Min}\left\{n \in \mathbf{N} \mid \operatorname{rad}((F))^{n} \subset(F)\right\}$.

Definition. - Let $\beta: \mathbf{N} \times \mathbf{N} \rightarrow \mathbf{N}$ be the numerical function:

$$
\beta(n,\{F=0\})=m(\{F=0\})(2 \mu(\{F=0\})+n+1) .
$$

Theorem 2.1. - Given a one-dimensional system of formal equations $\{F=0\}$, and a non-negative integer $n \geq 0$ if $Z_{F}$ is singular and $n \geq 1$ if $Z_{F}$ is non-singular. Let $X_{i}\left(X_{1}, \ldots, X_{r}\right) \in \mathbf{k}\left[\left[X_{1}, \ldots, X_{r}\right]\right]$, $1 \leq r \leq N, i=r+1, \ldots, N$ be a set of formal power series such that for every $G \in(F)$ :

$$
\begin{aligned}
G\left(X_{1}, \ldots, X_{r}, X_{r+1}\left(X_{1}, \ldots, X_{r}\right), \ldots,\right. & \left.X_{N}\left(X_{1}, \ldots, X_{r}\right)\right) \equiv 0 \\
& \text { modulo }\left(X_{1}, \ldots, X_{r}\right)^{\beta(n,\{F=0\})}
\end{aligned}
$$

Then there exist $\tilde{X}_{i}\left(X_{1}, \ldots, X_{r}\right) \in \mathbf{k}\left[\left[X_{1}, \ldots, X_{r}\right]\right], i=r+1, \ldots, N$, such that:
(1) $G\left(X_{1}, \ldots, X_{r}, \tilde{X}_{r+1}, \ldots, \tilde{X}_{N}\right)=0$ for all $G \in(F)$,
(2) $X_{i}\left(X_{1}, \ldots, X_{r}\right)-\tilde{X}_{i}\left(X_{1}, \ldots, X_{r}\right) \equiv 0$ modulo $\left(X_{1}, \ldots, X_{r}\right)^{n}$ for all $i=$ $r+1, \ldots, N$.

Proof. - First of all we will prove that $r=1$. From now on we put $\mu(\{F=0\})=\mu\left(Z_{F}\right)=\mu, \rho\left(Z_{F}, 0\right)=\rho$ and $e\left(Z_{F}, 0\right)=e$.

Let $J$ be the ideal of $R$ generated by $X_{i}-X_{i}\left(X_{1}, \ldots, X_{r}\right)$ for $i=$ $r+1, \ldots, N$. Notice that $J$ is the kernel of the $\operatorname{map} \varphi: R \rightarrow \mathbf{k}\left[\left[X_{1}, \ldots, X_{r}\right]\right]$ defined by

$$
\varphi(G)=G\left(X_{1}, \ldots, X_{r}, X_{r+1}\left(X_{1}, \ldots, X_{r}\right), \ldots, X_{N}\left(X_{1}, \ldots, X_{r}\right)\right)
$$

From the hypothesis we deduce that

$$
(F) \subset J \text { modulo }\left(X_{1}, \ldots, X_{r}\right)^{\beta(n,\{F=0\})}
$$

so

$$
\begin{equation*}
\operatorname{rad}((F)) \subset J \text { modulo }\left(X_{1}, \ldots, X_{r}\right)^{2 \mu+1+n} \tag{1}
\end{equation*}
$$

Recall [C] that

$$
\delta\left(Z_{F}\right)=\sum_{Q \in T\left(Z_{F}\right)} \rho\left(Z_{F}, Q\right)
$$

by [M], Proposition 12.14, we obtain that $\delta\left(Z_{F}\right)+1 \geq e$; from this we deduce $\mu \geq \delta\left(Z_{F}\right)$, so $\mu \geq \rho$.

From [M], Proposition 12.11, we get

$$
\operatorname{dim}_{\mathbf{k}}\left(\frac{R}{\operatorname{rad}((F))+M^{2 \mu+n+1}}\right)=e(2 \mu+n+1)-\rho
$$

Since $\operatorname{Spec}(R / J)$ is non-singular, from (1) we have

$$
e(2 \mu+n+1)-\rho \geq\binom{ 2 \mu+n+r}{r}
$$

Assume that $r \geq 2$, then $(2 \mu+n+1)(e-(\mu+1)-n / 2) \geq \rho$. Since $\mu \geq \rho \geq e-1$ ([M], Proposition 12.14) we obtain: $\rho \leq(2 \mu+n+1)(-n / 2)$. If $Z_{F}$ is singular then we get $\rho \leq 0$, but from [M], Propositions 12.14 and 12.17 , we have that $\rho \geq 1$, so $\mathrm{r}=1$. If $Z_{F}$ is non-singular we get that $\rho<0$, since $\rho$ is a non-negative integer ( $[\mathrm{M}]$, Propositions 12.14) we deduce $r=1$.

Consider the non-singular branch $Z_{1}$ which admits the parametrization:

$$
Z_{1}:\left\{\begin{array}{l}
X_{1}=t \\
X_{i}=X_{i}(t) \text { for all } i=2, \ldots, N
\end{array}\right.
$$

Notice that the series $\left.H_{i}=X_{i}-X_{i} X_{1}\right), i=2, \ldots, N$, form a system of generators of the ideal $I_{1}$ defining the curve $Z_{1}$. If $G \in \operatorname{rad}(F)$ then

$$
G\left(X_{1}, X_{2}\left(X_{1}\right), \ldots, X_{N}\left(X_{1}\right)\right) \equiv 0 \operatorname{modulo}\left(X_{1}\right)^{\mu+1+n}
$$

thus

$$
\operatorname{rad}((F)) \subset I_{1} \text { modulo }\left(X_{1}\right)^{\mu+1+n}
$$

From Propositions 1.2,1.3 and 1.4 we deduce the claim.
Remark. - (1) From the proof of the theorem it is easy to prove that for the systems of formal equations with $r=1$ one can take

$$
\beta(n,\{F=0\})=m(\{F=0\})(\mu(\{F=0\})+n+1) .
$$

(2) If we consider reduced systems of formal equations, i.e. $\operatorname{rad}((F))=(F)$, then we have

$$
\beta(n,\{F=0\})=2 \mu(\{F=0\})+n+1
$$

Notice that the number $2 \mu(\{F=0\})+1$ has the following property ( $[\mathrm{E}])$ : the analytic type of $Z_{F}$ is determined by any of its truncations: $\left(Z_{F}\right)_{n}=\operatorname{Spec}\left(R /(F)+M^{n}\right)$ for all $n \geq 2 \mu(\{F=0\})+1$.
