# PARTIALLY DEFINED COCYCLES <br> AND THE MASLOV INDEX FOR A LOCAL RING 

by Amedeo MAZZOLENI

## 1. Cocycles in general position.

Definition 1. - Let $G$ be a group. Let $Y$ be a subset of $G$. We say that $Y$ is 0 -dense if $Y \neq \emptyset$. Let $m \geqslant 1$. We say that $Y$ is $m$-dense if

$$
\left(g_{1} \cdot Y\right) \cap \ldots \cap\left(g_{m} \cdot Y\right) \neq \emptyset
$$

for all $g_{1}, \ldots, g_{m} \in G$.

Example 2. - Let $G$ be a topological group. If $U$ is an open dense subset of $G$, then $U$ is $m$-dense for all $m \geqslant 0$.

Proof. - This follows from

1. the set $g \cdot U$ is an open dense set, for $g \in G$;
2. the intersection of two open dense sets is an open dense set.

Lemma 3. - Let $Y$ be an $m$-dense subset of $G$. Then there exists $\left(g_{1}, \ldots, g_{m}\right) \in Y^{m}$ such that $g_{i} g_{i+1} \ldots g_{\imath+\jmath} \in Y$, for $1 \leqslant i \leqslant m$ and $0 \leqslant j \leqslant m-i$.

[^0]Proof. - We prove the lemma by induction on $m$. The lemma is true if $m=0$ or $m=1$.

We suppose that $m>1$. By the induction hypothesis there is $\left(g_{1}, \ldots, g_{m-1}\right)$ in $Y^{m-1}$ such that the product $g_{i} g_{i+1} \ldots g_{i+j} \in Y$, for $1 \leqslant i \leqslant m-1$ and $0 \leqslant j \leqslant m-1-i$. We choose $\widetilde{g}_{m} \in Y \cap\left(g_{1} \cdot Y\right) \cap$ $\ldots \cap\left(g_{1} g_{2} \ldots g_{m-1} \cdot Y\right)$. We let $g_{m}=\left(g_{1} g_{2} \ldots g_{m-1}\right)^{-1} \widetilde{g}_{m}$. We have that $\widetilde{g}_{m} \in\left(g_{1} g_{2} \ldots g_{\imath-1} \cdot Y\right) \cap\left(g_{1} g_{2} \ldots g_{m-1} \cdot Y\right)$, for $2 \leqslant i \leqslant m-1$. Hence $g_{i} g_{i+1} \ldots g_{m} \in Y$, for $1 \leqslant i \leqslant m$. This proves the lemma.

Let $m \geqslant 1$. We assume that $Y$ is an $m$-dense subset of $G$. Let $1 \leqslant n \leqslant m$. We let $Y_{\text {gen }}^{n}=\left\{\left(g_{1}, \ldots, g_{n}\right) \in Y^{n} \mid g_{i} \ldots g_{i+j} \in Y\right.$ for $1 \leqslant i \leqslant n$ and $0 \leqslant j \leqslant n-i\}$.

Let $B$ be an abelian group with trivial $G$-action. We consider the complex (of groups)

$$
0 \longrightarrow B \xrightarrow{0} C_{Y}^{1} \xrightarrow{d^{1}} C_{Y}^{2} \xrightarrow{d^{2}} \cdots \xrightarrow{d^{m-1}} C_{Y}^{m}
$$

where $C_{Y}^{n}=\operatorname{Map}\left(Y_{\text {gen }}^{n}, B\right)$ and

$$
\begin{aligned}
& d^{n-1}(f)\left(g_{1}, g_{2}, \ldots, g_{n-1}\right)=f\left(g_{2}, \ldots, g_{n-1}\right)-f\left(g_{1} g_{2}, \ldots, g_{n-1}\right)+\ldots \\
& \ldots+(-1)^{n-1} f\left(g_{1}, g_{2}, \ldots, g_{n-2}\right)
\end{aligned}
$$

Definition 4. - Let $0 \leqslant n \leqslant m-1$. An element of $\operatorname{ker} d^{n}$ is called $n$-cocycle for $Y$. We denote by $H_{Y}^{n}(G, B)$ the group $\operatorname{ker} d^{n} / \operatorname{im} d^{n-1}$.

Theorem 5. - Let $m \geqslant 1$. We assume that $Y$ is a $2 m$-dense subset of $G$. Let $0 \leqslant n \leqslant m-1$. Then the natural embedding $Y_{\operatorname{gen}}^{n} \rightarrow G^{n}$ induces an isomorphism between $H^{n}(G, B)$ and $H_{Y}^{n}(G, B)$. Moreover, if $c$ is an $n$ cocycle for $Y$, then there is an $n$-cocycle $\bar{c}$ such that its restriction to $Y_{\mathrm{gen}}^{n}$ is $c$.

This result will be proved in Section 3. A consequence of this theorem is the following corollary:

Corollary 6. - Let $G$ be a topological group. Let $U$ be an open dense subset of $G$. Then the natural embedding $U_{\text {gen }}^{n} \rightarrow G^{n}$ induces an isomorphism between $H^{*}(G, B)$ and $H_{U}^{*}(G, B)$. Moreover, if $c$ is an $n$ cocycle for $U$, then there is an $n$-cocycle $\bar{c}$ such that its restriction to $U_{\mathrm{gen}}^{n}$ is $c$.

## 2. The generalized Mayer-Vietoris sequence.

Definition 7. - Let $X$ be a $C W$-complex. We say that $X$ is -1 acyclic if $X \neq \emptyset$. Let $k \geqslant 0$. We say that $X$ is $k$-acyclic if $X$ is -1 -acyclic and $\widetilde{H}_{n}(X)=0$, for all $0 \leqslant n \leqslant k$. We say that $X$ is acyclic if it is $k$-acyclic for all $k \in \mathbb{N}$.

Let $X$ be a $C W$-complex which is the union of a family of non-empty subcomplexes $X_{\alpha}$, where $\alpha$ ranges over some totally ordered index set $I$. Let $K$ be the abstract simplicial complex whose vertex set is $I$ and whose simplices are the non-empty finite subsets $J$ of $I$ such that the intersection $\cap_{\alpha \in J} X_{\alpha}$ is non empty. We denote by $K^{(p)}$ the set of the $p$-simplices of $K$. Then (cf. [1] 166-167).

Proposition 8. - We have a spectral sequence $E$ such that

$$
E_{p, q}^{1}=\bigoplus_{J \in K^{(q)}} H_{p}\left(\bigcap_{\alpha \in J} X_{\alpha}\right) \Rightarrow H_{p+q}(X)
$$

Let $K$ be a simplicial set. Recall that $\bar{K}$, the geometric realization of $K$, is a $C W$-complex. Moreover $H_{*}(K)=H_{*}(\bar{K})$. We say that $K$ is $k$-acyclic if $\bar{K}$ is $k$-acyclic. The following corollary is a consequence of the Proposition 8.

Corollary 9. - Let $K$ be a simplicial set which is the union of a family of non-empty simplicial subsets $K_{\alpha}$, where $\alpha$ ranges over some index set $I$. Let $k \geqslant-1$. We suppose that $K_{\alpha_{1}} \cap K_{\alpha_{2}} \cap \ldots \cap K_{\alpha_{n}}$ is $k-n+1$-acyclic for all $1 \leqslant n \leqslant k+2$ and for all $\left\{\alpha_{1}, \ldots, \alpha_{n}\right\} \subset I$. Then $K$ is $k$-acyclic.

## 3. Proof of Theorem 5.

Let $X$ be a subset of the group $G$. We first assume that $1 \in Y$. We let $X_{Y}^{0}=X$. Let $n \geqslant 1$. We let $X_{Y}^{n}=\left\{\left(g_{0}, \ldots, g_{n}\right) \in X^{n+1} \mid g_{i}^{-1} g_{\jmath} \in Y\right.$ for all $i<j\}$. The two following assertions are straightforward.

1. $\partial_{\imath}\left(g_{0}, \ldots, g_{n}\right)=\left(g_{0}, \ldots, g_{i-1}, g_{i+1}, \ldots, g_{n}\right) \in X_{Y}^{n-1}$, for all $\left(g_{0}, \ldots, g_{n}\right)$ $\in X_{Y}^{n}$ and for $0 \leqslant i \leqslant n$.
2. $s_{i}\left(g_{0}, \ldots, g_{n}\right)=\left(g_{0}, \ldots, g_{i-1}, g_{i}, g_{i}, g_{2+1}, \ldots, g_{n}\right) \in X_{Y}^{n+1}$, for $0 \leqslant i \leqslant n$ and for all $\left(g_{0}, \ldots, g_{n}\right) \in X_{Y}^{n}$.

We consider the simplicial set $K_{Y}(X)$ whose $n$-simplices are the $\left(g_{0}, \ldots, g_{n}\right) \in X_{Y}^{n}$, the face operators are the $\partial_{i}$ 's and the degenerency operators are the $s_{\imath}$ 's. $\left(^{*}\right)$

Lemma 10. - Let $k \geqslant 0$. Let $X, Y \subset G$ such that $1 \in Y$. Assume that

$$
X \cap\left(g_{1} \cdot Y\right) \cap \ldots \cap\left(g_{2 k} \cdot Y\right) \neq \emptyset
$$

for all $g_{1}, \ldots, g_{2 k} \in X$. Then $K_{Y}(X)$ is $(k-1)$-acyclic.

Proof. - We prove the lemma by induction on $k$.
If $k=0$ then $X \neq \emptyset$. Hence $K_{Y}(X)$ is -1 -acyclic and the lemma is true.

We assume that $k>0$. Let $g \in X$ and denote by $K_{g}$ the simplicial subset of $K_{Y}(X)$ whose the $n$-simplices are the $\left(g_{0}, \ldots, g_{n}\right) \in X_{Y}^{n}$ such that $g=g_{0}$ or $\left(g, g_{0}, \ldots, g_{n}\right) \in X_{Y}^{n+1}$. Clearly $K_{Y}(X)=\bigcup_{g \in X} K_{g}$. Let $g_{1}, \ldots, g_{m} \in X$ such that $g_{\imath} \neq g_{\jmath}$ for $i \neq j$. We let $K_{g_{1}, \ldots, g_{m}}=$ $K_{g_{1}} \cap \ldots \cap K_{g_{m}}$. We will prove that $K_{g_{1}, \ldots, g_{m}}$ is $(k-m)$-acyclic, for $1 \leqslant m \leqslant k+1$ and for $\left(g_{1} \ldots, g_{m}\right) \in X^{m}$.

The geometric realization of $K_{g}$ is a cone, hence $K_{g}$ is acyclic. Let $2 \leqslant m \leqslant k+1$. Let $g_{1}, \ldots, g_{m} \in X$ such that $g_{2} \neq g_{\jmath}$, for $i \neq j$. We put $\bar{X}=X \cap\left(g_{1} \cdot Y\right) \cap \ldots \cap\left(g_{m} \cdot Y\right)$ and $\bar{X}_{Y}^{n}=\left\{\left(g_{0}, \ldots, g_{n}\right) \in \bar{X}^{n+1} \mid g_{\imath}^{-1} g_{\jmath} \in\right.$ $Y$ for all $i<j\}$. Then $K_{g_{1}, \ldots, g_{m}}=K_{Y}(\bar{X})$, the simplicial set whose the $n$-simplices are the $\left(g_{0}, \ldots, g_{n}\right) \in \bar{X}_{Y}^{n}$. Let $h_{1}, \ldots, h_{2(k-m+1)} \in \bar{X}$. Then

$$
\bar{X} \cap\left(h_{1} \cdot Y\right) \cap \ldots \cap\left(h_{2(k-m+1)} \cdot Y\right) \neq \emptyset
$$

since $m+2(k-m+1) \leqslant 2 k$.
Hence, by induction hypothesis, $K_{g_{1}, \ldots, g_{m}}$ is $(k-m)$-acyclic. From Corollary 9 follows that $K_{Y}(X)$ is $(k-1)$-acyclic. This proves the lemma.

Now we assume that $1 \notin Y$. We let $X_{Y}^{0}=X$. Let $n \geqslant 1$. We let $X_{Y}^{n}=\left\{\left(g_{0}, \ldots, g_{n}\right) \in X^{n+1} \mid g_{i}^{-1} g_{\jmath} \in Y\right.$ for all $\left.i<j\right\}$. Note that

1. If $i \neq j$, then $g_{\imath} \neq g_{j}$, for all $\left(g_{0}, \ldots, g_{n}\right) \in X_{Y}^{n}$.
2. $\partial_{\imath}\left(g_{0}, \ldots, g_{n}\right)=\left(g_{0}, \ldots, g_{\imath-1}, g_{\imath+1}, \ldots, g_{n}\right) \in X_{Y}^{n-1}$, for all $\left(g_{0}, \ldots, g_{n}\right)$ $\in X_{Y}^{n}$ and for $0 \leqslant i \leqslant n$.
It follows from (1) and (2) that there is a simplicial set $\bar{K}_{Y}(X)$ whose the non degenerate $n$-simplices are the $\left(g_{0}, \ldots, g_{n}\right) \in X_{Y}^{n}$ and the face operators are the $\partial_{i}$ 's defined above.

Note that $\bar{K}_{Y}(X)=K_{Y^{\prime}}(X)$, where $Y^{\prime}=Y \cup\{1\}\left(\right.$ see $\left.\left(^{*}\right)\right)$.
Lemma 11. - Let $k \geqslant 0$. Let $X, Y \subset G$ such that $1 \notin Y$. We assume that

$$
X \cap\left(g_{1} \cdot Y\right) \cap \ldots \cap\left(g_{2 k} \cdot Y\right) \neq \emptyset
$$

for all $g_{1}, \ldots, g_{2 k} \in G$. Then $\bar{K}_{Y}(X)$ is $(k-1)$-acyclic.

Proof. - We have that $\bar{K}_{Y}(X)=K_{Y^{\prime}}(X)$, where $Y^{\prime}=Y \cup\{1\}$. Clearly

$$
X \cap\left(g_{1} \cdot Y^{\prime}\right) \cap \ldots \cap\left(g_{2 k} \cdot Y^{\prime}\right) \neq \emptyset
$$

for all $g_{1}, \ldots, g_{2 k} \in G$. Hence this lemma is a consequence of Lemma 10.
We consider the complex $C=\left(C_{n}, \delta_{n}\right)_{n \geqslant-1}$, where

1. $C_{-1}=\mathbb{Z}$,
2. $C_{0}=\mathbb{Z} G$,
3. for $n \geqslant 1, C_{n}$ is the free abelian group generated by the elements of $G_{Y}^{n}=\left\{\left(g_{0}, \ldots, g_{n}\right) \in G^{n+1} \mid g_{i}^{-1} g_{j} \in Y\right.$ for all $\left.i<j\right\}$,
4. $\delta_{0}: C_{0} \rightarrow C_{-1}$ is the augmentation map,
5. for $n \geqslant 1, \delta_{n}: C_{n} \rightarrow C_{n-1}$ is defined by

$$
\delta_{n}\left(g_{0}, \ldots, g_{n}\right)=\sum_{\imath=0}^{n}(-1)^{i} \partial_{\imath}\left(g_{0}, \ldots, g_{n}\right) .
$$

Corollary 12. - Let $m \geqslant 1$. Let $Y$ be a $2 m$-dense subset of $G$. Then $H_{n}(C)=0$ for all $n \leqslant m-1$.

Proof. - This corollary is a consequence of Lemma 10 and Lemma 11.

Proof of Theorem 5. - Let $0 \leqslant n \leqslant m-1$. The complex $C$ defined above is a complex of $G$-modules, where the $G$-action is defined by $g \cdot\left(g_{0}, \ldots, g_{k}\right)=\left(g g_{0}, \ldots, g g_{k}\right)$. Then $C_{k}$ is free with basis $\left\{\left(1, g_{1}, \ldots, g_{1} \ldots g_{k}\right) \mid\left(g_{1}, \ldots, g_{k}\right) \in Y_{\text {gen }}^{k}\right\}$, for $k \leqslant 2 m$. This means that there is $\left(\bar{C}_{k}\right)_{k \geqslant 0}$ a free $\mathbb{Z} G$-resolution of $\mathbb{Z}$ such that $\bar{C}_{n+1}=C_{n+1}$. Hence $H_{Y}^{n}(G, B)$ is isomorphic to $H^{n}(G, B)$. Clearly the isomorphism is induced by the natural embedding $Y_{\text {gen }}^{n} \rightarrow G^{n}$. This proves part one.

We now prove the second part of the theorem. We consider an $n$ cocycle $\bar{c}$ and an $n$-cocycle for $Y c$ such that the class of the restriction of
$\bar{c}$ to $Y_{\text {gen }}^{n}$ in $H_{Y}^{n}(G, B)$ is the same of the class of $c$. There exists $f \in C_{Y}^{n-1}$ such that $\bar{c}=c+d^{n-1}(f)$. $\operatorname{But} \operatorname{Hom}\left(G^{n-1}, B\right)$ maps onto $C_{Y}^{n-1}$. This means that there exists $\bar{f}$ in $\operatorname{Hom}\left(G^{n-1}, B\right)$ which maps to $f$. It then follows that the $n$-cocycle $c^{\prime}$, defined by $c^{\prime}\left(g_{1}, g_{2}\right)=c\left(g_{1}, g_{2}\right)-\bar{f}\left(g_{1}\right)-\bar{f}\left(g_{1}\right)+\bar{f}\left(g_{1} g_{2}\right)$, maps to $c$.

Corollary 13. - Let $Y$ be a $2 m$-dense subset of $G$. Let $0 \leqslant n \leqslant$ $m-1$. We consider two $n$-cocycles $c, c^{\prime}$. We suppose that there exists $g \in G$ such that

$$
c\left(g_{1}, \ldots, g_{n}\right)=c^{\prime}\left(g g_{1} g^{-1}, \ldots, g g_{n} g^{-1}\right)
$$

for all $\left(g_{1}, \ldots, g_{n}\right) \in Y_{\text {gen }}^{n}$. Then $c$ and $c^{\prime}$ are cohomological equivalent.
Proof. - Let $n \leqslant m-1$. The set $g Y g^{-1}$ is a $2 m$-dense subset of $G$. The map $r_{g}: G \rightarrow G$ defined by $r_{g}(h)=g h g^{-1}$ induces two homomorphisms $i_{g}: H^{n}(G, B) \rightarrow H^{n}(G, B), i_{g}: H_{Y}^{n}(G, B) \rightarrow H_{g Y g^{-1}}^{n}(G, B)$ and the following commutative diagramm

where $i_{Y}$ and $i_{g Y g^{-1}}$ denote the isomorphisms induced by the natural embeddings $Y_{\text {gen }}^{n} \rightarrow G^{n}$ and $\left(g Y g^{-1}\right)_{\text {gen }}^{n} \rightarrow G^{n}$. Note that $i_{g}: H^{n}(G, B) \rightarrow$ $H^{n}(G, B)$ is the identity map. This proves the corollary.

## 4. An application.

In the second part of this paper we give an application of Theorem 5 .
Let $A$ be a local commutative ring such that $2 \in A^{*}$. Let $\mathfrak{M}$ denote the maximal ideal of $A$ and $K=A / \mathfrak{M}$. Let $V$ be a free $A$-module of dimension $2 n$ with a non-degenerate alternating form $\varphi$. For a subset $W$ of $V$, we set

$$
W^{\perp}=\{v \in V \mid \varphi(v, w)=0 \text { for all } w \in W\}
$$

A direct summand of $V$ is called subspace and a Lagrangian for $V$ is a subspace $W$ of dimension $n$ such that $W=W^{\perp}$. Let $X$ denote the set of the Lagrangians in $V$. Let $L_{1}, L_{2} \in X$. We say that $L_{1}$ is transversal to $L_{2}$, denoted $L_{1} \pitchfork L_{2}$, if $L_{1}+L_{2}=V$.

We let $\operatorname{Sp}(V)$ the symplectic group of $(V, \varphi)$, that is

$$
\operatorname{Sp}(V)=\{\alpha \in \operatorname{GL}(V) \mid \varphi(\alpha(x), \alpha(y))=\varphi(x, y) \text { for all } x, y \in V\}
$$

Let $W$ be a submodule of $V$. We let $\bar{W}=W \otimes_{A} K$ and $\bar{\varphi}: \bar{V} \times \bar{V} \rightarrow K$ denote the non-degenerate alternating form induced by $\varphi$. Finally $\bar{X}$ denotes the set of the Lagrangians in $\bar{V}$. We have

Lemma 14. - Let $\left\{v_{1}, \ldots, v_{2 n}\right\}$ be a basis of $V$. Then there exists a basis $\left\{u_{1}, \ldots, u_{2 n}\right\}$ of $V$ such that $\varphi\left(v_{i}, u_{j}\right)=\delta_{i j}$.

Proof. - The space $V^{\prime}$ denotes the dual of $V$. Then $d_{\varphi}: V \rightarrow V^{\prime}$ defined by $d_{\varphi}(x)=\varphi(-, x)$ is an isomorphism because $\varphi$ is non-degenerate. We consider the dual basis $\left\{z_{1}, \ldots, z_{2 n} \in V^{\prime}\right\}$ of $\left\{v_{1}, \ldots, v_{2 n}\right\}$ and we let $u_{i}=d_{\varphi}^{-1}\left(z_{i}\right)$. Then $\delta_{i j}=z_{i}\left(v_{j}\right)=d_{\varphi} d_{\varphi}^{-1}\left(z_{i}\right)\left(v_{j}\right)=\varphi\left(v_{j}, u_{i}\right)$.

Corollary 15. - Let $v_{1}, \ldots, v_{n} \in V$ such that $\bar{v}_{1}, \ldots, \bar{v}_{n}$ are linear independents in $\bar{V}$. Then there exists $\left\{u_{1}, \ldots, u_{n}\right\}$ a subset of $V$ such that $\varphi\left(v_{i}, u_{\jmath}\right)=\delta_{i j}$. Moreover, if $L_{2}$ is a Lagrangian of $V$ transversal to $L_{1} \in X$ and $\left\{v_{1}, \ldots, v_{n}\right\}$ is a basis of $L_{1}$, then there exists a basis $\left\{w_{1}, \ldots, w_{n}\right\}$ of $L_{2}$ such that $\varphi\left(v_{i}, w_{j}\right)=\delta_{i j}$.

Proof. - We prove only the second part of the corollary. We consider $\left\{v_{1}, \ldots, v_{n}\right\}$ a basis of $L_{1}$ and $\left\{v_{n+1}, \ldots, v_{2 n}\right\}$ a basis of $L_{2}$. There is a basis $\left\{w_{1}, \ldots, w_{2 n}\right\}$ of $V$ such that $\varphi\left(v_{i}, w_{j}\right)=\delta_{\imath j}$. This means that $w_{1}, \ldots, w_{n} \in L_{2}^{\perp}$. But $L_{2}=L_{2}^{\perp}$, hence $\left\{w_{1}, \ldots, w_{n}\right\}$ is a basis of $L_{2}$.

Corollary 16. $\quad X$ maps onto $\bar{X}$.

Proof. - Let $\left\{\bar{v}_{1}, \ldots, \bar{v}_{n} \in \bar{V}\right\}$ be a basis of $\bar{L}$, a Lagrangian for $\bar{V}$. We consider $\left\{v_{1}, \ldots, v_{n}\right\}$ a lift of $\left\{\bar{v}_{1}, \ldots, \bar{v}_{n}\right\}$ in $V$ and $m=\max \left\{k \mid \varphi\left(v_{i}, v_{j}\right)=0\right.$ for all $\left.1 \leqslant i, j \leqslant k\right\}$. We prove the corollary by induction on $n-m$.

If $n-m=0$, then the corollary is true.
Let $n-m \geqslant 1$. We choose $u_{1}, \ldots, u_{n} \in V$ such that $\varphi\left(v_{i}, u_{j}\right)=\delta_{i j}$. We put $\widetilde{v}_{i}=v_{i}$, if $i \neq m+1$ and $\widetilde{v}_{m+1}=v_{m+1}-\sum_{i=1}^{m} \varphi\left(v_{i}, v_{m+1}\right) u_{i}$. Clearly $\left\{\widetilde{v}_{1}, \ldots, \widetilde{v}_{n}\right\}$ is a lift of $\left\{\bar{v}_{1}, \ldots, \bar{v}_{n}\right\}$ because $\varphi\left(v_{i}, v_{m+1}\right) \in \mathfrak{M}$ for all $1 \leqslant i \leqslant m$. Moreover $\varphi\left(\widetilde{v}_{i}, \widetilde{v}_{j}\right)=0$ for all $1 \leqslant i, j \leqslant m+1$. This proves the corollary.

Corollary 17. - $\operatorname{Sp}(V)$ acts transitevely on $X$.

Proof. - Let $L_{0}, L_{1} \in X$. There are $\bar{L}_{2}, \bar{L}_{3} \in \bar{X}$ such that $\bar{L}_{0} \pitchfork \bar{L}_{2}$
and $\bar{L}_{1} \pitchfork \bar{L}_{3}$. Let $L_{0}, L_{1}, L_{2}, L_{3}$ be lifts of $\bar{L}_{0}, \bar{L}_{1}, \bar{L}_{2}, \bar{L}_{3}$ in $X$. Clearly $L_{0} \pitchfork L_{2}$ and $L_{1} \pitchfork L_{3}$. We choose $\left\{v_{1}, \ldots, v_{2 n}\right\}$ and $\left\{u_{1}, \ldots, u_{2 n}\right\}$ two basis of $V$ such that $\left\{v_{1}, \ldots, v_{n}\right\} \subset L_{0},\left\{v_{n+1}, \ldots, v_{2 n}\right\} \subset L_{1},\left\{u_{1}, \ldots, u_{n}\right\} \subset L_{2}$, $\left\{u_{n+1}, \ldots, u_{2 n}\right\} \subset L_{3}$ and $\varphi\left(v_{i}, v_{n+j}\right)=\varphi\left(u_{i}, u_{n+j}\right)=\delta_{i j}$ for all $1 \leqslant i, j \leqslant$ $n$. Now we consider $\alpha \in \mathrm{GL}(V)$ such that $\alpha\left(v_{i}\right)=u_{i}$, for $1 \leqslant i \leqslant 2 n$. Clearly $\alpha \cdot L_{0}=L_{1}$ and $\varphi(\alpha(x), \alpha(y))=\varphi(x, y)$ for all $x, y \in V$. Hence $\alpha \in \operatorname{Sp}(V)$.

Now we consider $\left(L_{1}, L_{2}, L_{3}\right) \in X^{3}$ such that $L_{2} \pitchfork L_{j}$ for $i \neq j$. We define $\psi: L_{1} \oplus L_{2} \oplus L_{3} \rightarrow V$ by $\psi\left(v_{1}, v_{2}, v_{3}\right)=v_{1}+v_{2}+v_{3}$. Then $\psi$ is surjective and $\mathcal{K}_{123}=\operatorname{ker} \psi$ is free of dimension $n$. We define the quadratic form $q: \mathcal{K}_{123} \rightarrow A$ by $q\left(v_{1}, v_{2}, v_{3}\right)=\varphi\left(v_{1}, v_{2}\right)$. Then $q$ is a nondegenerate quadratic form and the Maslov index of ( $L_{1}, L_{2}, L_{3}$ ), denoted by $m\left(L_{1}, L_{2}, L_{3}\right)$, is the class of $q$ in $W(A)$.

In comparison with [3], we do not define the Maslov index for all $\left(L_{1}, L_{2}, L_{3}\right)$ in $X^{3}$, but, using theorem 5 , we obtain (Theorem 24) an extension

$$
0 \longrightarrow I^{2}(A) \longrightarrow \widetilde{\operatorname{sp}(V)} \longrightarrow \operatorname{Sp}(V) \longrightarrow 1
$$

as in Theorem 2.2 of [3].
Proposition 18. - Let $\left(L_{0}, L_{1}, L_{2}, L_{3}\right) \in X^{4}$ such that $L_{\imath} \pitchfork L_{\jmath}$ for $i \neq j$. Then $m\left(L_{1}, L_{2}, L_{3}\right)-m\left(L_{0}, L_{2}, L_{3}\right)+m\left(L_{0}, L_{1}, L_{3}\right)-m\left(L_{0}, L_{1}, L_{2}\right)=0$.

Proof. - The proof is exactly the same as in the proof of Proposition 1.2 of [3].

Lemma 19. - Let $A$ be a local ring such that $|A / \mathfrak{M}| \geqslant m$. Then, given $m$ Lagrangians $L_{0}, L_{1}, \ldots, L_{m}$, there exists a Lagrangian $L$ such that $L \pitchfork L_{i}$, for $0 \leqslant i \leqslant m$.

Proof. - It follows from Corollary 16 that we just need to prove this lemma when $A=K$ a field.

Assume the dimension of $V$ is 2 . Then $K$ has more than $m$ 1dimensional subspaces and the lemma is true. We prove the lemma by induction on $\operatorname{dim} V$.

We show that there exists $v \in V, v \notin \cup_{i=0}^{m} L_{i}$. This is proved if $|K|=\infty$. Suppose $|K|=q$. Then a space of dimension $l$ has cardinality $q^{l}$. This means that $\left|\cup_{i=0}^{m} L_{i}\right| \leqslant(m+1) q^{m}<q^{2 m}=|V|$.

Let $V_{1}=v^{\perp}$ and $\bar{V}_{1}=V_{1} /\langle v\rangle$. Let $\bar{L}_{i}$ be the image of $L_{i} \cap V_{1}$ in $\bar{V}_{1}$. Then $\left\{\bar{L}_{i} \mid 0 \leqslant i \leqslant m\right\}$ are Lagrangians in $\bar{V}_{1}$. By induction on the dimension of $V$, there is a Lagrangian $\bar{L}$ in $\bar{V}_{1}$ such that $\bar{L} \pitchfork \bar{L}_{i}$, for $0 \leqslant i \leqslant m$. We consider $L$ the subspace of $V_{1}$ of dimension $n$ such that $L /\langle v\rangle=\bar{L}$. Then $L$ is a Lagrangian in $V$ and $L \pitchfork L_{i}, 0 \leqslant i \leqslant m$.

Corollary 20. - Let $A$ be a local ring such that $|A / \mathfrak{M}| \geqslant m$. We fix $L_{0} \in X$ and we consider $Y_{L_{0}}=\left\{g \in \operatorname{Sp}(V) \mid g \cdot L_{0} \pitchfork L_{0}\right\}$. Then $Y_{L_{0}}$ is $m$-dense.

Proof. - We first remark that, if $L_{1} \pitchfork L_{2}$, then $g \cdot L_{1} \pitchfork g \cdot L_{2}$, for $g \in \operatorname{Sp}(V)$ and $L_{1}, L_{2} \in X$. Let $g_{1}, \ldots, g_{m} \in \operatorname{Sp}(V)$. By the previous lemma there is an $L \in X$ transversal to $g_{i} \cdot L_{0}$, for $1 \leqslant i \leqslant m$. We choose $g \in S p(V)$ such that $g \cdot L_{0}=L$. Then $g \cdot L_{0} \pitchfork g_{i} \cdot L_{0}, 1 \leqslant i \leqslant m$. This means that $g_{i}^{-1} g \in Y_{L_{0}}$. But $g=g_{i} g_{i}^{-1} g$, hence $g \in\left(g_{1} \cdot Y_{L_{0}}\right) \cap \ldots \cap\left(g_{m} \cdot Y_{L_{0}}\right)$.

Now we fix $L_{0} \in X$ and define $c:\left(Y_{L_{0}}\right)_{\text {gen }}^{2} \rightarrow W(A)$ as follows:

$$
c\left(g_{1}, g_{2}\right)=m\left(L_{0}, g_{1} \cdot L_{0}, g_{1} g_{2} \cdot L_{0}\right)
$$

Proposition 21. - Let $A$ be a local ring such that $|A / \mathfrak{M}| \geqslant 6$. Then $c$ is a 2-cocycle for $Y_{L_{0}}$ which defines a central extension

$$
0 \longrightarrow W(A) \longrightarrow \widetilde{\operatorname{Sp(V}}) \longrightarrow \operatorname{Sp}(V) \longrightarrow 1
$$

This extension is independent of the choice of $L_{0}$.
Note that $A / \mathfrak{M}$ is a field. Hence $|A / \mathfrak{M}| \geqslant 6$ implies that $|A / \mathfrak{M}| \geqslant 7$.
Proof. - Let $L_{1}, L_{2}, L_{3} \in X$ such that $L_{i} \pitchfork L_{j}$, for $i \neq j$. We remark that $m\left(L_{1}, L_{2}, L_{3}\right)=m\left(g \cdot L_{1}, g \cdot L_{2}, g \cdot L_{3}\right)$, for $g \in G$. It then follows that $c$ is a 2-cocycle for $Y_{L_{0}}$. Hence, using Theorem 5 and Corollary 20, we see that $c$ induces $(\star)$.

We are now left with proving that $(\star)$ is independent of the choice of $L_{0}$.

Let $L_{1} \in X$. We consider $c^{\prime}$, the 2-cocycle for $Y_{L_{1}}$ defined by

$$
c^{\prime}\left(g_{1}, g_{2}\right)=m\left(L_{1}, g_{1} \cdot L_{1}, g_{1} g_{2} \cdot L_{1}\right)
$$

We choose $g \in G$ such that $g \cdot L_{0}=L_{1}$. Let $\left(g_{1}, g_{2}\right) \in\left(Y_{L_{1}}\right)_{g e n}^{2}$. We have that

$$
\begin{aligned}
c^{\prime}\left(g_{1}, g_{2}\right) & =m\left(L_{1}, g_{1} \cdot L_{1}, g_{1} g_{2} \cdot L_{1}\right)=m\left(g \cdot L_{0}, g g^{-1} g_{1} g \cdot L_{0}, g g^{-1} g_{1} g_{2} g \cdot L_{0}\right) \\
& =m\left(L_{0}, g^{-1} g_{1} g \cdot L_{0}, g^{-1} g_{1} g_{2} g \cdot L_{0}\right)=c\left(g^{-1} g_{1} g, g^{-1} g_{2} g\right)
\end{aligned}
$$

Hence the proposition follows from Corollary 13.
In the last part of this paper we will prove that $c$ can be reduced to

$$
\bar{c}:\left(Y_{L_{0}}\right)_{\mathrm{gen}}^{2} \rightarrow I^{2}(A)
$$

We consider the map $t: Y_{L_{0}} \rightarrow W(A)$, defined by $t(g)=\left\langle\mathrm{id}_{n}\right\rangle$, where $\mathrm{id}_{n}$ denotes the bilinear space $\left(A^{n}, \iota_{n}\right)$ defined by

$$
\iota_{n}\left(\left(x_{1}, \ldots, x_{n}\right),\left(y_{1}, \ldots, y_{n}\right)\right)=x_{1} y_{1}+\ldots+x_{n} y_{n}
$$

Let $\left(g_{1}, g_{2}\right) \in\left(Y_{L_{0}}\right)_{\text {gen }}^{2}$. We put $c^{\prime}\left(g_{1}, g_{2}\right)=c\left(g_{1}, g_{2}\right)-t\left(g_{1}\right)-t\left(g_{2}\right)+t\left(g_{1} g_{2}\right)$.
Lemma 22. - $c^{\prime}$ is a 2-cocycle for $Y_{L_{0}}$ and $c^{\prime}\left(\left(Y_{L_{0}}\right)_{\text {gen }}^{2}\right) \subset I(A)$.
Let $L, L_{0} \in X$ such that $L \pitchfork L_{0}$. We choose $B=\left\{v_{1}, \ldots, v_{n}\right\}$ a basis of $L$ and $B_{0}=\left\{u_{1}, \ldots, u_{n}\right\}$ a basis of $L_{0} . M\left((L, B),\left(L_{0}, B_{0}\right)\right)$ denotes the matrix $\left(r_{i j}\right)=-\varphi\left(v_{i}, u_{j}\right)$. The matrix $M\left((L, B),\left(L_{0}, B_{0}\right)\right)$ is in $G L_{n}(A)$ because $L \pitchfork L_{0}$.

Proposition 23. - Let $\left(L_{1}, L_{2}, L_{3}\right) \in X^{3}$ such that $L_{\imath} \pitchfork L_{\jmath}$ for $i \neq j$. We choose $B_{1}=\left\{v_{1}, \ldots, v_{n}\right\}$ a basis of $L_{1}, B_{2}=\left\{u_{1}, \ldots, u_{n}\right\}$ a basis of $L_{2}$ and $B_{3}=\left\{w_{1}, \ldots, w_{n}\right\}$ a basis of $L_{3}$. Then

$$
\partial\left(m\left(L_{1}, L_{2}, L_{3}\right)\right)=(-1)^{n(n-1) / 2} \cdot \overline{\operatorname{det}}\left(M_{23}\right) \cdot \overline{\operatorname{det}}\left(M_{13}\right)^{-1} \cdot \overline{\operatorname{det}}\left(M_{12}\right)
$$

where $M_{\imath \jmath}$ denotes the matrix $M\left(\left(L_{\imath}, B_{\imath}\right),\left(L_{\jmath}, B_{\jmath}\right)\right)$, the map $\partial: W(A) \rightarrow$ $A^{*} /\left(A^{*}\right)^{2}$ denotes the signed determinant and $\overline{\operatorname{det}}$ denotes the homomorphism between $\mathrm{GL}_{n}(A)$ and $A^{*} /\left(A^{*}\right)^{2}$ induced by the determinant.

Proof. - The proof is exactly the same as the first part of the proof of Proposition 2.1 of [3].

We fix $L_{0} \in X$. Let $B_{0}=\left\{v_{i} \mid 1 \leqslant i \leqslant n\right\}$ be a basis of $L_{0}$. Then $g \cdot B_{0}=\left\{g \cdot v_{i} \mid 1 \leqslant i \leqslant n\right\}$ is a basis of $g \cdot L_{0}$, for $g \in \operatorname{Sp}(V)$. We consider the map $t_{L_{0}}: Y_{L_{0}} \rightarrow I(A)$, defined by

$$
t_{L_{0}}(g)=\left\langle\operatorname{det}\left(M\left(\left(L_{0}, B_{0}\right),\left(g \cdot L_{0}, g \cdot B_{0}\right)\right)\right),(-1)^{n(n-1) / 2}\right\rangle
$$

Let $\left(g_{1}, g_{2}\right) \in\left(Y_{L_{0}}\right)_{\text {gen }}^{2}$. We let $\bar{c}\left(g_{1}, g_{2}\right)=c^{\prime}\left(g_{1}, g_{2}\right)-t_{L_{0}}\left(g_{1}\right)-t_{L_{0}}\left(g_{2}\right)+$ $t_{L_{0}}\left(g_{1} g_{2}\right)$.

Theorem 24. - Let $A$ be a local ring such that $|A / \mathfrak{M}| \geqslant 7$. Then $\bar{c}$ is a 2-cocycle for $Y_{L_{0}}$ which induces a central extension

$$
0 \longrightarrow I^{2}(A) \longrightarrow \widetilde{\mathrm{Sp(V})} \longrightarrow \mathrm{Sp}(V) \longrightarrow 1
$$

Acknowledgments. - I would like to thank Dr. Gael Collinet for the helpful discussions and for having send me his thesis [2]. In his paper I have in particular found many useful informations about the study of the acyclicity of semi-simplicial sets.
