# ON THE SPACE <br> OF MAPS INDUCING ISOMORPHIC CONNECTIONS 

by T.R. RAMADAS

## 1. Introduction .

In this paper we prove the following

Theorem. - Let M be a smooth compact manifold, P a principal bundle on M with the unitary group $\mathrm{U}(k)$ as structure group, A a smooth connection on P , and Aut A the group of gauge transformations [i.e., automorphisms of P which act trivially on $\mathrm{M}]$ which leave A invariant. Let B be the Grassmanian of $k$-planes in a separable Hilbert space He, E the Stiefel bundle of orthonormal $k$ frames in He, and $\omega$ the canonical universal connection on E . Denote by $\Sigma(\mathrm{A})$ the space of maps $p: \mathrm{M} \longrightarrow \mathrm{B}$ such that the pull-back bundle $p^{*}(\mathrm{E})$, with the connection $p^{*} \omega$, is isomorphic to ( $\mathrm{P}, \mathrm{A}$ ).

Then the space $\Sigma(\mathrm{A})$, with the $\mathrm{C}^{\infty}$ topology, has the homotopy type of $\mathrm{B}_{(\mathrm{AutA})}$ where $\mathrm{B}_{(\mathrm{Aut} \mathrm{A})}$ is the base-space of a universal bundle for Aut A.

The connectedness of $\Sigma(\mathrm{A})$ is shown in [6]. We use some ideas from this paper.

To motivate this result, consider the case when $P$ is a principal G-bundle with $G$ a compact Lie group. Let Aut $P$ denote the group of gauge transformations of $P$. Denote by $\mathbb{C}$ the space of $C^{\infty}$ connections on $P$. The group Aut $P$ acts on $\mathbb{C}$, though not freely in general. Denote by $\underset{\sim}{\mathcal{C}}$ the quotient.

By [4] there exists a finite dimensional principal G-bundle $\mathrm{E}(\mathrm{G}, \mathrm{M}) \longrightarrow \mathrm{B}(\mathrm{G}, \mathrm{M})$ with connection such that the following diagram commutes, and the map $\varphi$ is onto:

Here $\operatorname{Mor}_{G}(\mathrm{P}, \mathrm{E}(\mathrm{G}, \mathrm{M})$ ) is the space of G -morphisms of P into E and $\operatorname{Mor}_{\mathrm{P}}(\mathrm{M}, \mathrm{B}(\mathrm{G}, \mathrm{M}))$ is the component of $\mathrm{C}^{\infty}(\mathrm{M}, \mathrm{B}(\mathrm{G}, \mathrm{M}))$ which induces pull-back bundles isomorphic to $P$. $\mathcal{L}$ is the map given by pulling back the universal connection on $\mathrm{E}(\mathrm{G}, \mathrm{M})$.

We wish to investigate the fibres of the map $\varphi$. It is possible to do so when we consider instead of $\mathrm{E}(\mathrm{G}, \mathrm{M})$ a universal bundle $\mathrm{E}_{\mathrm{G}}$ with connection such that $\mathrm{E}_{\mathrm{G}}$ is contractible. Suppose then, that in the above diagram we replace $E(G, M)$ by $E_{G}$ and $B(G, M)$ by $\mathrm{B}_{\mathrm{G}}$. Let $\mathrm{A} \in \mathbb{C}$ and $\underset{\sim}{A}$ its class in $\underset{\sim}{\mathbb{C}}$. We argue heuristically :

The spaces $\mathfrak{e}$ and $\operatorname{Mor}_{G}\left(\mathrm{P}, \mathrm{E}_{\mathrm{G}}\right)$ are both contractible. This would imply that $\varphi^{-1}(\mathrm{~A})$ is contractible (all the mappings being assumed to be good fibrations). The group Aut A acts on $\varphi^{-1}(\mathrm{~A})$ to give ${\underset{\sim}{-1}}^{-1}(\underset{\sim}{A})$. If all goes well this implies
a) $\varphi^{-1}(\mathrm{~A}) \longrightarrow \underline{\varphi}^{-1}(\underset{\sim}{\mathrm{~A}})$ is a universal Aut A bundle. The fibre over A of the map $\underset{\sim}{\varphi}$ has the same homotopy type as $\mathrm{B}_{(\mathrm{AutA})}$.
b) If G has trivial centre and all connections are generic (i.e. Aut P acts freely on e) $\underset{\sim}{\varphi}$ has a section.

The quotient space $\mathfrak{C}$ is relevant in studies of Yang-Mills theories, at present very popular in Physics. It has been pointed out [1] that the Universal Connection Theorem could possibly provide connections between Yang-Mills theories and so-called $\sigma$-models which concern themselves with the space $\operatorname{Mor}(\mathrm{M}, \mathrm{B})$. Also in the cases when $\underline{\varphi}$ has a section, it could give an alternative to "gaugefixing" which has been shown to be impossible in general [3, 7, 5].

The paper is organized as follows. In § 2 we imbed E and B as closed submanifolds of Hilbert spaces. In § 3 we describe a one parameter family of isometries $\mathrm{A}_{t}: \mathcal{H} \longrightarrow \mathcal{H}$, and also give the
$\mathrm{C}^{\infty}$ topology to be used on the function spaces $\operatorname{Mor}_{\mathrm{U}(k)}(\mathrm{P}, \mathrm{E})$ and $\operatorname{Mor}_{\mathrm{P}}(\mathrm{M}, \mathrm{B})$. In § 4 we prove that $\varphi^{-1}(\mathrm{~A})$ is contractible [Proposition 4.1] using the isometries $A_{t}$. Then we prove [Proposition 4.3] that $\varphi^{-1}(\mathrm{~A}) \longrightarrow{\underset{\sim}{\mid}}^{-1}(\underset{\sim}{A})$ is a locally trivial principal fibre space with Aut A as structure group. This involves, among other things, proving that the above projection is closed [Lemma 4.4], which is done by studying a certain differential equation. The completeness of the $\mathrm{C}^{\infty}$ topology is crucial, and the imbeddings obtained in § 2 simplify proofs throughout.

I would like to thank M.S. Narasimhan for several suggestions and much encouragement. I also thank M.S. Raghunathan, S. Ramanan and V . Sunder for their help.

## 2. The bundle of orthonormal $k$-frames in a Hilbert space.

Fix an integer $k>0$. Let $\mathcal{H e}$ be an infinite dimensional separable Hilbert space over the complex numbers. Denote by $E$ the space of orthonormal $k$-frames in $\mathcal{H}$. The group $\mathrm{U}(k)$ acts on E on the right and the quotient is the Grassmannian B of $k$-dimensional subspaces of $\mathcal{H e}$. In fact $E$ is a universal principal bundle for $U(k)$. It also carries a natural connection, which is a universal connection for $U(k)$.

It will be useful, in the following, to have characterizations of E and B as closed submanifolds of Hilbert spaces.

We shall identify a point $p$ in B with the orthogonal projector onto the corresponding subspace, denoted by $\mathrm{H}(p)$. Thus $\mathrm{H}(p)=\{x \in \mathcal{H} \mid p x=x\}$. For $p_{0} \in \mathrm{~B}$, define

$$
\mathscr{P}_{0}=\left\{p \in \mathrm{~B} \mid \mathrm{H}\left(p_{0}\right) \cap \operatorname{ker} p=\{0\}\right\} .
$$

Then we have a bijection $\mathrm{L}_{0}: \mathscr{P}_{0} \longrightarrow \mathscr{L}\left(\mathrm{H}\left(p_{0}\right)\right.$, $\left.\operatorname{ker} p_{0}\right)$ such that for $p \in \mathscr{P}_{0}$ its image $\mathrm{L} \equiv \mathrm{L}_{0}(p)$ has $\mathrm{H}(p)$ as graph.

Lemma 2.1 [2]. - The charts $\left\{\left(\mathscr{R}_{0}, \mathrm{~L}_{0}\right)\right\}$ give B the structure of a $\mathrm{C}^{\infty}$ Hilbert manifold.

Let $\mathcal{J}_{2}$ denote the Hilbert space of Hilbert-Schmidt operators on \%e.

Proposition 2.2. - Let $\psi$ denote the injection $\mathrm{B} \longrightarrow \mathcal{J}_{2}$ given by associating to each $k$-dimensional subspace its orthogonal projector. Then $\psi$ is a $\mathrm{C}^{\infty}$ immersion, and a homeomorphism onto its image.

Proof. - Follows from Lemmas 2.3 and 2.4.
Remark. - This shows that B , with the manifold structure given in Lemma 2.1 is a submanifold of $\mathscr{J}_{2}$.

Lemma 2.3. - On a chart $\left(\mathscr{R}_{0}, \mathrm{~L}_{0}\right) \psi$ is given by $(1-3)$. It is a $\mathrm{C}^{\infty}$ immersion.

Proof. - Let $\mathrm{L} \in \mathscr{L}\left(\mathrm{H}\left(p_{0}\right)\right.$, ker $\left.p_{0}\right)$ and let $\quad p=\psi \mathrm{L}_{0}^{-1}(\mathrm{~L})$. Write

$$
\begin{equation*}
p=\mathrm{A}+\mathrm{LA} \tag{1}
\end{equation*}
$$

where $\mathrm{A}: \mathcal{H} \longrightarrow \mathrm{H}\left(p_{0}\right)$. Then we claim that A satisfies

$$
\begin{equation*}
\mathrm{A}=p_{0}+\mathrm{L}^{+}\left(1-p_{0}\right)-\mathrm{L}^{+} \mathrm{LA} \tag{2}
\end{equation*}
$$

which can be solved to give

$$
\begin{equation*}
\mathrm{A}=\frac{1}{1+\mathrm{L}^{+} \mathrm{L}}\left(p_{0}+\mathrm{L}^{+}\left(1-p_{0}\right)\right) \tag{3}
\end{equation*}
$$

To see that $p$ given by (2.1)-(2.3) is indeed equal to $\psi \mathrm{L}_{0}^{-1}(\mathrm{~L})$, we verify :
a) Image of $p=\left\{x+\mathrm{L} x \mid x \in \mathrm{H}\left(p_{0}\right)\right\}$. The map is clearly into this set. In fact it is onto since $A$ is invertible on $H\left(p_{0}\right)$.
b) $p^{2}=p$. This follows since $\mathrm{A} p=p$, which in turn is clear because $\mathrm{A} p$ satisfies the same equation as $p$.

$$
\begin{aligned}
\mathrm{A} p=p_{0} p+\mathrm{L}^{+}\left(1-p_{0}\right) p-\mathrm{L}^{+} \mathrm{LA} p & =\mathrm{A}+\mathrm{L}^{+} \mathrm{LA}-\mathrm{L}^{+} \mathrm{LA} p \\
& =p_{0}+\mathrm{L}^{+}\left(1-p_{0}\right)-\mathrm{L}^{+} \mathrm{LA} p
\end{aligned}
$$

c) $p$ is an orthogonal projector, for

$$
\operatorname{ker} p=\left\{y-\mathrm{L}^{+} y \mid y \in \operatorname{ker} p_{0}\right\}
$$

which is the orthogonal subspace to $\operatorname{Im} p$.
(i) $\psi$ is $\mathrm{C}^{\infty}$ : To see this split $\psi$ into the steps:

$\psi$ is in fact real-analytic.
(ii) It is enough to check the differential at $L=0$. Here $\delta p=\delta \mathrm{L}^{+}\left(1-p_{0}\right)+p_{0} \delta \mathrm{~L}$ which is clearly injective. Also the image, being defined by $p_{0} \delta p p_{0}=\left(1-p_{0}\right) \delta p\left(1-p_{0}\right)=0$ and $\delta p^{+}=\delta p$, is closed, and hence admits a supplement.

Lemma 2.4. - The inverse $\psi^{-1}$ is given by (4) and is continuous.
Proof. - Consider a chart $\left(\mathscr{R}_{0}, \mathrm{~L}_{0}\right)$. Let $p \in \mathscr{R}_{0}$ and let $\mathrm{Q}=\left(\left.p_{0}\right|_{\mathrm{H}(p)}\right)^{-1} . \quad$ Then for $x \in \mathrm{H}(p), \mathrm{Q} x=x+\left(1-p_{0}\right) p \mathrm{Q} x$. This gives, for $\mathrm{L}=\left(1-p_{0}\right) \mathrm{Q}, \mathrm{L}=\left(1-p_{0}\right) p(1+\mathrm{L})$.

This can be solved to give $p \underset{\psi^{-1}}{\longmapsto} \mathrm{~L}$ such that

$$
\begin{equation*}
\mathrm{L} x=\left(1-p_{0}\right) \frac{1}{1-\left(1-p_{0}\right) p} x, x \in \mathrm{H}\left(p_{0}\right) \tag{4}
\end{equation*}
$$

The continuity of $\psi^{-1}$ follows easily.
We turn now to E . This can be identified with a closed subset of $\mathscr{L}\left(\mathbf{C}^{k}, \mathscr{H}\right): \mathrm{E}=\left\{\mathrm{U}: \mathbf{C}^{k} \longrightarrow \mathscr{H} \mid \mathrm{U}^{+} \mathrm{U}=1\right\}$. Standard arguments show:

Lemma 2.5. - E is a closed submanifold of $\mathfrak{f}\left(\mathbf{C}^{k}, \mathcal{H}\right)$. It is a principal $\mathrm{U}(k)$ bundle on B . The $u(k)$-valued one-form $\mathrm{U}^{+} \mathrm{dU}$ is a connection on E .

Lemma 2.6. - E is contractible and hence a universal $\mathrm{U}(k)$ bundle. The connection is a universal $\mathrm{U}(k)$ connection.

Proof. - Both statements are well-known. The first follows also from the remarks after Lemma 4.2. The second is a consequence of the Universal Connection Theorem.

## 3. Some preliminary remarks and definitions.

(i) A one-parameter-family of isometries on He.

Following [6], we introduce, on \%e, a one-parameter family of isometries which we will use later. Define, for $t \in[0,1]$ an isometry $\mathrm{A}_{t}: \mathcal{H} \longrightarrow \mathcal{H}$ as follows. Fix an orthonormal basis, so that $\mathcal{H} \approx$ \{square-summable sequences in $C\}$. Then let $A_{0}=$ Identity

$$
\begin{aligned}
& \mathrm{A}_{t}\left(a_{0}, a_{1}, a_{2}, \ldots\right)=\left(a_{0}, a_{1} \ldots a_{n-2}, a_{n-1} \cos \theta_{n}(t), a_{n-1} \sin \theta_{n}(t)\right. \\
& \left.\qquad a_{n} \cos \theta_{n}(t), a_{n} \sin \theta_{n}(t) a_{n+1} \cos \theta_{n}(t), a_{n+1} \sin \theta_{n}(t) \ldots\right) \\
& \text { for } \frac{1}{n+1} \leqslant t \leqslant \frac{1}{n} \text { where } \theta_{n}(t)=\frac{\pi}{2} n[(n+1) t-1]
\end{aligned}
$$

The $A_{t}$ are continuous in $t$ w.r. to the strong operator topology. Note that

$$
\begin{aligned}
& \mathrm{A}\left(\frac{1}{2}\right)\left(a_{0}, a_{1}, \ldots\right)=\left(a_{0}, 0, a_{1} 0, \ldots\right) \in \mathcal{H}_{\text {even }} \\
& \mathrm{A}(1)\left(a_{0}, a_{1}, \ldots\right)=\left(0, a_{0}, 0, a_{1}, \ldots\right) \in \mathcal{Y}_{\mathrm{odd}}
\end{aligned}
$$

where $\mathcal{H}_{\text {even }}$ and $\mathscr{H}_{\text {odd }}$ denote obvious subspaces of $\mathcal{H}$.
(ii) The topology of the function spaces $\operatorname{Mor}_{\mathrm{U}(k)}(\mathrm{P}, \mathrm{E})$ $\operatorname{Mor}(\mathrm{M}, \mathrm{B})$.

We topologize $\operatorname{Mor}_{\mathrm{U}(k)}(\mathrm{P}, \mathrm{E})$ as a (closed) subset of

$$
\mathrm{C}^{\infty}\left(\mathrm{P}, \mathfrak{f}\left(\mathbf{C}^{k}, \mathcal{H}\right)\right)
$$

and $\operatorname{Mor}(\mathrm{M}, \mathrm{B})$ as a (closed) subset of $\mathrm{C}^{\infty}\left(\mathrm{M}, \boldsymbol{J}_{2}\right)$. The $\mathrm{C}^{\infty}$ topology is described below :

Let $X$ be a compact manifold and $\mathcal{F}$ a Hilbert space. Let $\mathrm{X}_{1}, \ldots, \mathrm{X}_{q}$ be a set of vector fields on X which together span the tangent space at each point of X . For a multi index $\alpha=\left(\alpha_{1}, \ldots, \alpha_{2}\right)$
set $\mathrm{D}^{\alpha}=\mathrm{X}_{1}^{\alpha_{1}}, \ldots, \mathrm{X}_{q}^{\alpha} q$. We make $\mathrm{C}^{\infty}(\mathrm{X}, \mathcal{F})$ a Frechet space w.r. to the seminorms $\|f\|_{\alpha}=\sup _{x}\left\|\mathrm{D}^{\alpha} f\right\|$ where the heavy bars $\|\|$ denote the Hilbert space norm. The topology is clearly independent of the choice of $X_{1}, \ldots, X_{q}$. If $N \subset \mathcal{F}$ is a closed submanifold then $C^{\infty}(X, N)$ is a closed subset of $C^{\infty}(X, \mathcal{F})$ and we give it the relative topology, which makes it a complete metric space.

We choose now, once and for all, a set of vector fields $\mathrm{X}_{1}, \ldots, \mathrm{X}_{p}$ spanning the tangent space of $M$ at each point. Let $\hat{X}_{1}, \ldots \hat{X}_{p}$ be their lifts to $P$ w.r. to some connection, and let $\hat{Y}_{1}, \ldots, \hat{Y}_{k^{2}}$ be vertical vector fields on $P$, the images of a fixed basis $Y_{1}, \ldots, Y_{k^{2}}$ in $u(k)$ by the group action. We will use these to determine the seminorms. Note that $\left[\hat{X}_{i}, \hat{\mathrm{Y}}_{\ell}\right]=0 \forall \mathrm{X}_{i}$ and $\mathrm{Y}_{\ell}$. We will let let $\alpha_{\mathrm{L}}=\left(\alpha_{1}, \ldots, \alpha_{k^{2}}\right)$ and $\alpha=\left(\alpha_{1}, \ldots, \alpha_{p}\right)$, and write the seminorms as $\|f\|_{\alpha_{L}, \alpha}=\sup _{x \in \mathrm{P}}\left\|\mathrm{D}^{\alpha_{\mathrm{L}}} \mathrm{D}^{\alpha_{f}}\right\|$.

When there is no need to distinguish between the vertical and horizontal vectors we simply denote $\left(\alpha_{\mathrm{L}}, \alpha\right)$ by $\gamma$.

Lemma 3.1.- $\operatorname{Mor}_{\mathrm{U}(k)}(\mathrm{P}, \mathrm{E})$ and $\operatorname{Mor}(\mathrm{M}, \mathrm{B})$ are closed subsets of $\mathrm{C}^{\infty}\left(\mathrm{P}, \mathfrak{f}\left(\mathrm{C}^{k}, \mathcal{H}\right)\right)$ and $\mathrm{C}^{\infty}\left(\mathrm{M}, \boldsymbol{y}_{2}\right)$ respectively. The map $\operatorname{Mor}_{\mathrm{U}(k)}(\mathrm{P}, \mathrm{E}) \longrightarrow \operatorname{Mor}(\mathrm{M}, \mathrm{B})$ is continuous.

Proof. - For $g \in \mathrm{U}(k)$ the map $\mathrm{C}^{\infty}(\mathrm{P}, \mathrm{E}) \longrightarrow \mathrm{C}^{\infty}(\mathrm{P}, \mathrm{E})$ given by $f \longmapsto g f^{g}, f^{g}(x) \equiv f(x g) g^{-1}(x \in \mathrm{P})$, is continuous. This follows since

$$
\begin{aligned}
\left\|f_{1}^{g}-f_{2}^{g}\right\|_{\alpha_{\mathrm{L}}, \alpha} & =\sup _{x \in \mathrm{P}}\left\|\mathrm{D}_{x}^{\alpha_{\mathrm{L}}} \mathrm{D}_{x}^{\alpha}\left(f_{1}(x g) g^{-1}-f_{2}(x g) g^{-1}\right)\right\| \\
& =\sup _{x \in \mathrm{P}}\left\|\mathrm{D}_{x}^{\alpha_{\mathrm{L}}} \mathrm{D}_{x}^{\alpha}\left(f_{1}(x g)-f_{2}(x g)\right)\right\| \\
& =\sup _{x g \in \mathrm{P}}\left\|\mathrm{D}_{x g}^{\left[\alpha_{\mathrm{L}}, g\right]} \mathrm{D}_{x g}^{\alpha}\left(f_{1}(x g)-f_{2}(x g)\right)\right\| \\
& =\left\|f_{1}-f_{2}\right\|_{\left[\alpha_{2}, g\right], \alpha}
\end{aligned}
$$

where $\mathrm{D}^{\left[\alpha_{L}, g\right]}$ denotes the differential operator

$$
\mathrm{D}^{\left[\alpha_{L}, g\right]}=\left(\widehat{g}^{-1} \mathrm{Y}_{1} g\right)^{\alpha_{1}} \ldots\left(\widehat{g}^{-1} \mathrm{Y}_{k^{2}} g\right)^{\alpha_{k}}
$$

Here $\widehat{g}^{-1} \mathrm{Y}_{i} g$ is the image of the Lie algebra element $\widehat{g}^{-1} \widehat{Y}_{i} g$. This proves the first statement. To prove the second statement, let $f_{n} \longrightarrow f$ in $\operatorname{Mor}_{\mathrm{U}(k)}(\mathrm{P}, \mathrm{E})$ and let $p_{n}=f_{n} f_{n}^{+}$. Then

$$
\begin{aligned}
\left\|p_{n}-p\right\|_{\alpha} & =\sup _{x \in \mathrm{~B}}\left\|\mathrm{D}^{\alpha}\left(p_{n}-p\right)\right\| \quad\left(\text { where } \quad \mathrm{D}^{\alpha}=\mathrm{X}_{1}^{\alpha} \ldots \mathrm{X}_{n}^{\alpha}{ }^{\alpha}\right) \\
& =\sup _{x \in \mathrm{P}}\left\|\mathrm{D}^{\alpha}\left(p_{n}-p\right)\right\| \quad\left(\text { where } \quad \mathrm{D}^{\alpha}=\hat{\mathrm{X}}_{1}^{\alpha} \ldots \hat{\mathrm{X}}_{n}^{\alpha_{n}}\right) \\
& =\sup _{x \in \mathrm{P}}\left\|\sum_{\beta \leqslant \alpha}\binom{\alpha}{\beta}\left(\mathrm{D}^{\alpha-\beta} f_{n} \mathrm{D}^{\beta} f_{n}^{+}-\mathrm{D}^{\alpha-\beta} f \mathrm{D}^{\beta} f^{+}\right)\right\| \\
& \leqslant \alpha \mid \sum_{\beta<\alpha}\left\|f_{n}\right\|_{\beta}\left\|f_{n}-f\right\|_{\alpha-\beta}+\|f\|_{\alpha-\beta}\left\|f_{n}-f\right\|_{\beta}
\end{aligned}
$$

This proves $p_{n} \longrightarrow p$ in $\operatorname{Mor}(\mathrm{M}, \mathrm{B})$.

## 4. The topology of the fibres.

We will be interested in the fibres of the map $\underset{\sim}{\varphi}$. Consider first a fibre of $\varphi$.

Proposition 4.1. - Let $\mathrm{A} \in \mathbb{C}$. Then $\varphi^{-1}(\mathrm{~A})$ is contractible. In other words th space of morphisms $\mathrm{P} \rightarrow \mathrm{E}$ which induce a fixed connection on P is contractible.

Proof. - The proof proceeds in two steps.
(i) Define a map

$$
\xi: \varphi^{-1}(\mathrm{~A}) \times[0,1 / 2] \longrightarrow \varphi^{-1}(\mathrm{~A})
$$

by

$$
\xi_{t}(f)(x)=\mathrm{A}_{t} \circ f(x)\left\{\begin{array}{l}
f \in \varphi^{-1}(\mathrm{~A}) \\
x \in \mathrm{P} \\
t \in[0,1 / 2]
\end{array}\right.
$$

The map is into $\varphi^{-1}(\mathrm{~A})$ since,
a) $\xi_{t}(f)(x g)=\mathrm{A}_{t} \circ f(x g)(g \in U(k))=\mathrm{A}_{t} \circ f(x) \circ g$

$$
=\xi_{t}(f)(x) \circ g U
$$

b) $\xi_{t}(f)^{+} d \xi_{t}(f)=f^{+} d f=\mathrm{A}$.

By lemma 4.2 below $\xi$ is continuous.
(ii) There exists a $f_{0} \in \varphi^{-1}(\mathrm{~A})$ s.t. $\forall x \in \mathrm{P}, f_{0}(x)$ maps $\mathrm{C}^{k}$ into $\mathcal{H}_{\text {odd }}$ [Apply $\mathrm{A}_{1}$ to any $f \in \varphi^{-1}(\mathrm{~A})$ to get such an $f_{0}$ ]. Define for $t \in[1 / 2,1]$ a map $\eta: \varphi^{-1}(\mathrm{~A}) \times[1 / 2,1] \longrightarrow \varphi^{-1}(\mathrm{~A})$ by

$$
\eta_{t}(f)(x) v=(\sin t \pi) \mathrm{A}_{1 / 2} f(x) v-\cos t \pi f_{0}(x) v
$$

Again the map is into $\varphi^{-1}(\mathrm{~A})$. Note that $\mathrm{A}_{1 / 2} f$ maps into $\mathcal{H e}_{\text {even }}$. This means that $\forall(x, t), \eta_{t} f(x)$ defines an isometry of $\mathbf{C}^{k}$ into $\mathcal{H e}$, for, given $v, v^{\prime} \in \mathrm{C}^{k}$,

$$
\begin{aligned}
\left(\eta_{t} f(x) v, \eta_{t} f(x) v^{\prime}\right) & =\sin ^{2} t \pi\left(\mathrm{~A}_{1 / 2} f(x) v, \mathrm{~A}_{1 / 2} f(x) v^{\prime}\right) \\
& +\left(\cos ^{2} t \pi\right)\left(f_{0}(x) v, f_{0}(x) v^{\prime}\right)=\left(v, v^{\prime}\right)
\end{aligned}
$$

where (, ) denotes the inner product.
The points a), b) above can be checked easily. Lemma 4.2 gives continuity.
(iii) Compose $\xi$ and $\eta$ to get the contraction

$$
\psi: \varphi^{-1}(\mathrm{~A}) \times[0,1] \longrightarrow \varphi^{-1}(\mathrm{~A}) . \text { (See diagram) }
$$

Lemma 4.2. - The maps $\xi, \eta$ constructed in the proof of Proposition 4.1 are continuous (in the product topology).

Proof. - Consider the map $\xi$. Let $\left(f_{n}, t_{n}\right)$ be a sequence in $\varphi^{-1}(\mathrm{~A}) \times[0,1 / 2]$. Then

$$
\begin{aligned}
\left\|\xi_{t_{n}}\left(f_{n}\right)-\xi_{t}(f)\right\|_{\gamma} & =\sup _{x \in \mathrm{P}}\left\|\mathrm{~A}_{t n} \circ \mathrm{D}^{\gamma} f_{n}-\mathrm{A}_{t} \circ \mathrm{D}^{\gamma} f\right\| \\
& =\sup _{x \in \mathrm{P}}\left\|\mathrm{~A}_{t n} \circ \mathrm{D}^{\gamma}\left(f_{n}-f\right)+\left(\mathrm{A}_{t_{n}}-\mathrm{A}_{t}\right) \circ \mathrm{D}^{\gamma} f\right\| \\
& \leqslant\left\|f_{n}-f\right\|_{\gamma}+\left\|\left(\mathrm{A}_{t_{n}}-\mathrm{A}_{t}\right) f\right\|_{\gamma}
\end{aligned}
$$

This shows continuity of $\xi$. The continuity of $\eta$ follows similarly.
Remark. - The proof of Proposition 4.1 can be extended to prove contractivility of $\mathrm{Mor}_{\mathrm{U}(k)}(\mathrm{P}, \mathrm{E})$. In particular, taking $\mathrm{P}=\mathrm{U}(k)$, we see that E itself is contractible.

We turn now to the fibres of the map $\varphi$. Note that if $A \in C$ and $\underset{\sim}{A} \in \mathbb{C}$ is its class, then $\varphi^{-1}(\mathrm{~A})$ projects onto $\mathscr{L}^{-1}(\underset{\sim}{A})$. Also if Aut $A$ is the subgroup of Aut that leaves $A$ fixed $\operatorname{Aut}(\mathrm{A})$ acts freely on $\varphi^{-1}(\mathrm{~A})$, the quotient being in bijection with ${\underset{\sim}{\varphi}}^{-1}(\underset{\sim}{A})$.

Aut A is the space of maps $\hat{g}: \mathrm{P} \longrightarrow \mathrm{U}(k)$ such that
(i) $\hat{g}(x h)=h^{-1} g(x) h \quad x \in P, h \in U(k)$
(ii) $\mathrm{A}=\hat{g}^{-1} \mathrm{~A} \hat{g}+\hat{g}^{-1} d \hat{g}$.

Since $\hat{g} \in$ Aut A is determined by its value at a fixed point in P , we shall, fixing $y_{0} \in \mathrm{P}$ (projecting onto $x_{0} \in \mathrm{M}$ ) identify Aut A $\ni \hat{g} \sim \hat{g}\left(y_{0}\right) \in \mathrm{U}(k)$.

Thus Aut A is a closed subgroup of $\mathrm{U}(k)$ [This is seen either from the equation (ii) above, or noting the fact that under the above identification Aut A is the centralizer of the holonomy group at $y_{0}$ ] and hence a Lie subgroup.

From now on we assume that the vector fields $\hat{\mathrm{X}}_{1} \ldots \hat{\mathrm{X}}_{p}$ have been lifted to P w.r. to A. Note that then $\hat{X}_{i}(\hat{g})=0$ for $\hat{g} \in$ Aut A.

Proposition 4.3. $-\varphi^{-1}(\mathrm{~A}) \longrightarrow{\underset{\sim}{1}}^{-1}(\underset{\sim}{\mathrm{~A}})$ is $a$ locally trivial principal fibre space with Aut A as structure group.

Proof. - The proof proceeds in four steps.
a) Aut (A) acts continuously on $\varphi^{-1}(\mathrm{~A})$. For suppose $\left(f_{n}, \hat{g}_{n}\right) \in \varphi^{-1}(\mathrm{~A}) \times$ Aut A and $\left(f_{n}, \hat{g}_{n}\right) \longrightarrow(f, \hat{g})$. Then for any $\alpha_{L}, \alpha$

$$
\begin{aligned}
\| f_{n} \circ \hat{g}_{n} & -f \circ \hat{g}\left\|_{\alpha_{L}, \alpha} \leqslant\right\|\left(f_{n}-f\right) \circ \hat{g}_{n}\left\|_{\alpha_{L}, \alpha}+\right\| f \circ\left(\hat{g}_{n}-\hat{g}\right) \|_{\alpha_{L}, \alpha} \\
& =\sup _{x}\left\|\mathrm{D}^{\alpha_{\mathrm{L}}}\left(\left[\mathrm{D}^{\alpha}\left(f_{n}-f\right)\right] \hat{g}_{n}\right)\right\|+\sup _{x} \| \mathrm{D}^{\alpha} \begin{array}{l}
\mathrm{L}\left(\left[\mathrm{D}^{\alpha} f\right]\left(\hat{g}_{n}-\hat{g}\right)\right) \| \\
\left(\text { since } \mathrm{D}^{\alpha} \hat{g}=0\right)
\end{array} \\
& =\sup _{x}\left\|\sum_{\beta_{\mathrm{L}} \leqslant \alpha_{\mathrm{L}}}\binom{\alpha_{\mathrm{L}}}{\beta_{\mathrm{L}}} \mathrm{D}^{\alpha_{\mathrm{L}}-\beta_{\mathrm{L}}} \mathrm{D}^{\alpha}\left(f_{n}-f\right) \mathrm{D}^{\beta_{\mathrm{L}}} \hat{g}_{n}\right\| \\
& +\sup _{x}\left\|\sum_{\beta_{\mathrm{L}} \leqslant \alpha_{\mathrm{L}}}\binom{\alpha_{\mathrm{L}}}{\beta_{\mathrm{L}}} \mathrm{D}^{\alpha_{\mathrm{L}}-\beta_{\mathrm{L}}} \mathrm{D}^{\alpha} f \mathrm{D}^{\beta_{\mathrm{L}}}\left(\hat{g}_{n}-\hat{g}\right)\right\| \\
& \leqslant \alpha_{\mathrm{L}}!\| \|_{\beta_{\mathrm{L}} \leqslant \alpha_{\mathrm{L}}}\left\|f_{n}-f\right\|_{\alpha_{\mathrm{L}}-\beta_{\mathrm{L}}, \alpha}\left\|\hat{g}_{n}\right\|_{\beta_{\mathrm{L}}}+\|f\|_{\alpha_{\mathrm{L}}-\beta_{\mathrm{L}}, \alpha}\left\|\hat{g}_{n}-\hat{g}\right\|_{\beta_{\mathrm{L}}} .
\end{aligned}
$$

Now, for any $\hat{\mathrm{Y}}_{i}, \hat{g} \in$ Aut A

$$
\hat{Y}_{i}(\hat{g})=\lim _{t \rightarrow 0} \frac{\hat{g}\left(x \exp t Y_{i}\right)-\hat{g}(x)}{t}=\left[\hat{g}(x), Y_{i}\right]
$$

Also, if $\hat{g}_{1}, \hat{g}_{2}$ are in Aut A, $d\left(\operatorname{Tr}\left(\hat{g}_{1}-\hat{g}_{2}\right)^{+}\left(\hat{g}_{1}-\hat{g}_{2}\right)\right)=0$, so that $\left\|\hat{g}_{1}(x)-\hat{g}_{2}(x)\right\|=\left\|\hat{g}_{1}\left(y_{0}\right)-\hat{g}_{2}\left(y_{0}\right)\right\|$.

So, we have

$$
\begin{aligned}
\left\|f_{n} \circ \hat{g}_{n}-f \circ \hat{g}\right\|_{\alpha_{\mathrm{L}}, \alpha} & \leqslant \alpha_{\mathrm{L}}!\sum_{\beta_{\mathrm{L}} \leqslant \alpha_{\mathrm{L}}}\left\|f_{n}-f\right\|_{\alpha_{\mathrm{L}}-\beta_{\mathrm{L}}, \alpha}\left\|\hat{g}_{n}\right\|_{\beta_{\mathrm{L}}} \\
& +\|f\|_{\alpha_{\mathrm{L}}-\beta_{\mathrm{L}}, \alpha} \mathrm{C}_{\beta_{\mathrm{L}}}\left\|\hat{g}_{n}\left(p_{0}\right)-\hat{g}\left(p_{0}\right)\right\|
\end{aligned}
$$

where $C_{\beta_{L}}$ is a constant depending on the multiindex $\beta_{L}$.
b) Denote by $\mathbf{G}$ the graph of the equivalence relation defined by Aut A on $\varphi^{-1}(\mathrm{~A})$. Then the map $\mathbf{G} \longrightarrow$ Aut A is continuous. This follows since the map is given by $\left(f_{1}, f_{2}\right) \longmapsto f_{1}^{+}\left(y_{0}\right) f_{2}\left(y_{0}\right)$ which is clearly continuous.
c) The projection $\varphi^{-1}(\mathrm{~A}) \longrightarrow{\underset{\sim}{\varphi}}^{-1}(\underset{\sim}{\mathrm{~A}})$ is continuous and closed. Continuity follows from lemma 3.1 and lemma 4.4 shows that it is closed. Thus ${\underset{\sim}{~}}^{-1}(\underset{\sim}{A})$ has the quotient topology w.r. to the projection.
d) Thus we have shown that $\varphi^{-1}(\mathrm{~A}) \longrightarrow{\underset{\sim}{\varphi}}^{-1}(\underset{\sim}{\mathrm{~A}})$ is a principal fibre space. Now note that there is a Aut A-morphism

given by $f \longmapsto f\left(y_{0}\right)$. Since $\mathrm{E} \longrightarrow \mathrm{E} /$ Aut A is locally trivial, the proof is complete.

Lemma 4.4. - The map $\varphi^{-1}(\mathrm{~A}) \longrightarrow{\underset{\sim}{\varphi}}^{-1}(\underset{\sim}{\mathrm{~A}})$ is closed.
Proof. - Let $f_{n} \in \varphi^{-1}(\mathrm{~A})$ s.t. $p_{n}=f_{n} f_{n}^{+} \longrightarrow p$ in $\underline{\sim}^{-1}(\underset{\sim}{\mathrm{~A}})$.
It is enough to prove that $\left\{f_{n}\right\}$ contains a convergent subsequence. Since $p_{n}\left(x_{0}\right) \longrightarrow p\left(x_{0}\right)$ and E has compact fibres one
can assume $f_{n}\left(y_{0}\right) \longrightarrow g_{0} \in \mathrm{E}$ without loss of generality. Note that the $f_{n}$ satisfy

$$
\begin{equation*}
d f_{n}=f_{n} \mathrm{~A}+d p_{n} f_{n} \tag{5}
\end{equation*}
$$

We now prove that the $f_{n}$ are Cauchy in the $\mathrm{C}^{0}$ norm so that $\exists$ a $\mathrm{C}^{0}$ function $f$ such that $f_{n} \longrightarrow f$. Put $\mathrm{D}=f_{n}-f_{m}$. Then from (5) we have
$d\left(\mathrm{DD}^{+}\right)=\mathrm{DD}^{+} d p_{n}+d p_{n} \mathrm{DD}^{+}+d\left(p_{n}-p_{m}\right) f_{m} \mathrm{D}^{+}+\mathrm{D}_{m}^{+} d\left(p_{n}-p_{m}\right)$.
Evaluating on a vector field $\mathrm{X}_{t}$, taking the trace and then absolute value of both sides we get

$$
\begin{aligned}
\left|\mathrm{X}_{t} \operatorname{Tr}\left(\mathrm{DD}^{+}\right)\right| & \leqslant\left|\operatorname{Tr}\left(\mathrm{DD}^{+} \mathrm{X}_{t} p_{n}\right)\right|+\left|\operatorname{Tr}\left(\mathrm{X}_{t}\left(p_{n}\right) \mathrm{DD}^{+}\right)\right| \\
& +\left|\operatorname{Tr}\left(\mathrm{X}_{t}\left(p_{n}-p_{m}\right) f_{m} \mathrm{D}^{+}\right)\right|+\left|\operatorname{Tr}\left(\mathrm{D} f_{m}^{+} \mathrm{X}_{t}\left(p_{n}-p_{m}\right)\right)\right| \\
& \leqslant 2\left\{\|\mathrm{D}\|^{2}\left\|\mathrm{X}_{t} p_{n}\right\|+\|\mathrm{D}\|\left\|\mathrm{X}_{t}\left(p_{n}-p_{m}\right)\right\|\right\}
\end{aligned}
$$

or,

$$
\begin{equation*}
\left|\mathrm{X}_{t}\|\mathrm{D}\|^{2}\right| \leqslant 2\left\{\|\mathrm{D}\|^{2}\left\|\mathrm{X}_{t} p_{n}\right\|+\left\|\mathrm{X}_{t}\left(p_{n}-p_{m}\right)\right\|\right\} \tag{6}
\end{equation*}
$$

Consider now the set $\left\{\mathrm{X}_{i}, \mathrm{Y}_{\ell}\right\}$ which we collectively denote by $\left\{\mathrm{Z}_{j}\right\}$. They give a map from $\mathrm{P} \times \mathbf{R}^{\mathrm{N}}$ (where $\mathrm{N}=k^{2}+p$ ) to the tangent bundle TP which is onto:

$$
\left(x,\left(t_{1} \ldots t_{\mathrm{N}}\right)\right) \longmapsto\left(x, \sum_{i} t_{i} Z_{i}(x)\right)
$$

Take the obvious metric on the vector bundle $\mathbf{P} \times \mathbf{R}^{n}$. This induces a splitting of the above map as well as a Riemannian metric on $P$. Then we have the following obvious result: if $X$ is a vector field on P of norm $\leqslant 1$ and we express $\mathrm{X}=\Sigma a_{i} \mathrm{Z}_{i}$ with respect to the above splitting then $\left|a_{i}\right| \leqslant 1 \forall i$.

Now let $y \in \mathrm{P}$ and let $\Gamma(y)$ be a minimal geodesic joining $y_{0}$ to $y$ [such a geodesic exists for P compact] parametrized with respect to arc-length. Then the length of $\Gamma(y)<\mathrm{T}$ for some constant T independent of $y$. Now let $\mathrm{X}_{t}$ be the tangent vector field to $\Gamma$ (which is necessarily of norm one). This gives

$$
\left\|\mathrm{X}_{t}\left(p_{n}-p_{m}\right)\right\|=\sum_{i}\left\|p_{n}-p_{m}\right\|_{i} \text { where } \begin{aligned}
\|p\|_{i} & =\sup _{x}\left\|\mathrm{Z}_{i} p\right\| \\
& =\sum_{|\alpha|=1}\left\|p_{n}-p_{m}\right\|_{\alpha}
\end{aligned}
$$

Thus we have, from (6)

$$
\left|\mathrm{X}_{t}\|\mathrm{D}\|^{2}\right|=2\left\{a\|\mathrm{D}\|^{2}+b\|\mathrm{D}\|\right\}
$$

with

$$
a=\sum_{|\alpha|=1}\|p\|_{\alpha}+c, c>0
$$

and

$$
b=\sum_{\alpha}\left\|p_{n}-p_{m}\right\|_{\alpha}
$$

Consider the ordinary differential equation

$$
\begin{aligned}
& \frac{d u^{2}}{d t^{2}}=2\left(a u^{2}+b u\right) \\
& u(0)=\mathrm{D}\left(y_{0}\right)
\end{aligned}
$$

The solution is clearly:

$$
u(t)=\mathrm{D}\left(y_{0}\right) e^{a t}+\frac{\left(e^{a t}-1\right)}{a} b
$$

Consider the set $\mathrm{K}=\{t \geqslant 0 \mid\|\mathrm{D}(t)\|>u(t)\}$. K is open, and hence a union of disjoint open intervals. Let $t_{0}$ be its least boundary point. Clearly $\mathrm{D}\left(t_{0}\right)=u\left(t_{0}\right)$. From the polygonal approximations to $\left\|\mathrm{D}\left(t_{0}\right)\right\|^{2}$ and $u^{2}(t)$ it is clear that in an interval $\left(t_{0}, t_{0}+\epsilon\right)$ we have $\|\mathrm{D}(t)\| \leqslant u(t)$. Thus $\mathrm{K}=\varnothing$. We have finally,

$$
\|\mathrm{D}(y)\| \leqslant \mathrm{D}\left(y_{0}\right) e^{a \mathrm{~T}}+\frac{\left(e^{a \mathrm{~T}}-1\right)}{a} b
$$

which clearly shows that $\left\{f_{n}\right\}$ are Cauchy in the $\mathrm{C}^{0}$ norm.
Let $f$ be the $C^{0}$ limit. We now turn back to (5) and 'bootstrap' the above result to show that $f$ is $\mathrm{C}^{\infty}$ and $f_{n} \longrightarrow f$ in the $\mathrm{C}^{\infty}$ topology. Assume, therefore, that $f$ is $\mathrm{C}^{k}$ and $f_{n} \longrightarrow f$ in $\mathrm{C}^{k}$. For any multi-index $\gamma(|\gamma| \geqslant 1)$ define $\gamma^{\prime}$ and $\mathrm{X}^{(\gamma)}$ [here $\mathrm{X}^{(\gamma)}$ is one of the vector fields $\mathrm{Z}_{i}$ ] by $\mathrm{D}^{\gamma}=\mathrm{D}^{\gamma^{\prime}} \mathrm{X}^{(\gamma)}$ so that $\mathrm{D}^{\gamma^{\prime}}$ is of order $|\gamma|-1$. Let $|\gamma|=k+1$. Then

$$
\begin{aligned}
\mathrm{D}^{\gamma} f_{n} & =\mathrm{D}^{\gamma^{\prime}} \mathrm{X}^{(\gamma)}\left(f_{n}\right)=\mathrm{D}^{\gamma^{\prime}}\left(f_{n} \mathrm{~A}\left(\mathrm{X}^{(\gamma)}\right)+\mathrm{X}^{(\gamma)}\left(p_{n}\right) f_{n}\right) \\
& =\sum_{\delta \leqslant \gamma^{\prime}}\binom{\gamma^{\prime}}{\delta}\left[\mathrm{D}^{\gamma^{\prime}-\delta} f_{n} \mathrm{D}^{\delta} \mathrm{A}\left(\mathrm{X}^{(\gamma)}\right)+\mathrm{D}^{\gamma^{\prime}-\delta} \mathrm{X}^{(\gamma)}\left(p_{n}\right) \mathrm{D}^{\delta} f_{n}\right]
\end{aligned}
$$

Then

$$
\begin{aligned}
\| \mathrm{D} f_{n} & -\sum_{\delta \leqslant \gamma^{\prime}}\binom{\gamma^{\prime}}{\delta}\left[\mathrm{D}^{\gamma^{\prime}-\delta} f \mathrm{D}^{\delta} \mathrm{A}\left(\mathrm{X}^{(\gamma)}\right)+\mathrm{D}^{\gamma^{\prime}-\delta} \mathrm{X}^{(\gamma)}(p) \mathrm{D}^{\delta} f\right] \| \\
& \leqslant \gamma!\sum_{\delta<\gamma^{\prime}}\left\|f_{n}-f\right\|_{\gamma-\delta}\left\|\mathrm{A}\left(\mathrm{X}^{(\gamma)}\right)\right\|_{\delta}+\left\|p_{n}\right\|_{\gamma^{\prime}-\delta, \mathrm{x}}(\gamma)
\end{aligned}\left\|f_{n}-f\right\|_{\delta} \quad \text { } \quad+\left\|p_{n}-p\right\|_{\gamma^{\prime}-\delta, \mathrm{x}(\gamma)}\|f\|_{\delta} \quad l
$$

where $\|f\|_{\gamma^{\prime}-\delta, \mathrm{X}^{(\gamma)}} \equiv \sup _{x}\left\|\mathrm{D}^{\gamma^{\prime}-\delta} \mathrm{X}^{(\gamma)} f\right\|$.

This shows $\mathrm{D}^{\gamma} f_{n}$ tends uniformly to a $\mathrm{C}^{0}$ function, and hence $f$ is $\mathrm{C}^{k+1}$. By induction $f$ is $\mathrm{C}^{\infty}$ and $f_{n} \longrightarrow f$ in $\mathrm{C}^{\infty}(\mathrm{P}, \mathrm{E})$. The proof also shows $d f=f \mathrm{~A}+p f$.

Since $\operatorname{Mor}_{\mathrm{U}(k)}(\mathrm{P}, \mathrm{E})$ is closed, $f \in \operatorname{Mor}_{\mathrm{U}(k)}(\mathrm{P}, \mathrm{E})$ and $p=f f^{+}$ by continuity of the projection $\operatorname{Mor}_{\mathrm{U}(k)}(\mathrm{P}, \mathrm{E}) \longrightarrow \operatorname{Mor}_{p}(\mathrm{M}, \mathrm{B})$. (One can now easily show that $f^{+} d f=\mathrm{A}$, thus showing that the fibre ${\underset{\sim}{\varphi}}^{-1}(\mathrm{~A})$ is closed. This is because we have nowhere in the proof used the fact that $\left.p \in{\underset{\sim}{\mid}}^{-1}(\underset{\sim}{A})\right)$.

The Theorem stated in the Introduction now follows.
