# IMPROVEMENT OF GRAUERT-RIEMENSCHNEIDER'S THEOREM <br> FOR A NORMAL SURFACE 

by Jean GIRAUD

## 1. Vanishing theorem.

1.1. A surface is a noetherian, excellent, normal scheme of dimension 2 . A desingularization of $\mathbf{X}$ is a proper and birational map $f: \widetilde{X} \rightarrow X$ such that $\widetilde{\mathrm{X}}$ is regular. The set
(1) $\quad$ Sing $(f)=\left\{x \in X, \operatorname{dim}\left(f^{-1}(x)\right)>0\right\}$
is made up of finitely many closed points and $f$ is an isomorphism above
(2) $\mathrm{X}_{f}=\mathrm{X}-\operatorname{Sing}(f) \subset \mathrm{X}_{\mathrm{reg}}=\left\{x \in \mathrm{X}, 0_{\mathrm{X}, x}\right.$ is regular $\}$.

We usually denote by $E_{i}$ the irreducible components of

$$
\begin{equation*}
\mathrm{E}(f)=f^{-1}(\operatorname{Sing}(f)) \tag{3}
\end{equation*}
$$

and for $\mathbf{A}=\mathbf{N}, \mathbf{Z}$ or $\mathbf{Q}$, we let
(4)

$$
\mathrm{NS}(f, \mathrm{~A})=\oplus \mathrm{AE}_{i}
$$

We do not assume that $\mathrm{X}_{f}=\mathrm{X}_{\text {reg }}$, hence X itself may be regular. For any $\mathbf{V}=\Sigma \mathrm{V}_{i} . \mathrm{E}_{i} \in \mathrm{NS}(f, \mathbf{Q})$, we write
(5) $\mathrm{V} \geqslant 0$ when all $\mathrm{V}_{i}$ are $\geqslant 0$
(6) $\mathrm{V} \geq 0$ when all $-\mathrm{V} . \mathrm{E}_{i}$ are $\geqslant 0$.

Note that the minus sign is justified by

$$
\begin{equation*}
\mathrm{V} \gg 0 \Rightarrow \mathrm{~V} \geqslant 0 \tag{7}
\end{equation*}
$$

To prove (7) we let $V=V_{+}-V_{-}$; since $V \geq 0$, we have
$0 \leqslant-\mathrm{V} . \mathrm{V}=-\mathrm{V}_{+} . \mathrm{V}_{-}+\mathrm{V}_{-}^{2} \leqslant \mathrm{~V}_{-}^{2}$, hence $\mathrm{V}_{-}=0$, since the intersection matrix is negative definitive. We introduce the dual basis of $\mathrm{NS}(f, \mathbf{Q})$

$$
\begin{equation*}
\mathrm{E}_{i}^{*} \text { defined by } \mathrm{E}_{i}^{*} \cdot \mathrm{E}_{j}=-\delta_{i j} \tag{8}
\end{equation*}
$$

and we observe that

$$
\begin{equation*}
\mathrm{E}_{i}^{*} \geq 0, \quad \mathrm{dE}_{i}^{*} \in \mathrm{NS}(f, \mathbf{N}) \tag{9}
\end{equation*}
$$

where $d$ is the absolute value of the determinant of the intersection matrix.

Lemma 1.2. - For any $\mathrm{V} \in \mathrm{NS}(f, \mathbf{Q})$ there exists a unique $[\mathrm{V}] \in \mathrm{NS}(f, \mathbf{Z})$ such that
(i) $\mathrm{V} \ll[\mathrm{V}]$,
(ii) if $\mathrm{W} \in \mathrm{NS}(f, \mathrm{Z})$ and if $\mathrm{V}<\mathrm{W}$ then $[\mathrm{V}] \leqslant \mathrm{W}$.

We will prove that $[\mathrm{V}]$ is the infimum for the usual order relation of $\mathbf{E}(\mathbf{V})=\{\mathbf{W} \in \operatorname{NS}(f, \mathbf{Z}), \mathbf{V}<\mathbf{W}\}$. Let $\mathbf{N} \in \mathbf{Z}$ be such that $\mathrm{dN} \leqslant \inf \left(\mathrm{V} . \mathrm{E}_{i}\right)$; we have $-\mathrm{dN} \Sigma \mathrm{E}_{i}^{*} \in \mathrm{E}(\mathrm{V})$, hence $\mathrm{E}(\mathrm{V})$ is non empty. For $i=1,2$, let $W_{i}=\Sigma \mathbf{W}_{i, j} \mathrm{E}_{j} \in \mathrm{E}(\mathrm{V})$ and let $\mathrm{Z}=\Sigma \mathrm{Z}_{j} \mathrm{E}_{j}$ with $\mathrm{Z}_{j}=\inf \left(\mathrm{W}_{1, j}, \mathrm{~W}_{2, j}\right)$. By Artin's trick we prove that $\mathrm{Z} \in \mathrm{E}(\mathrm{V})$ as follows. For any $j$, we have $\mathbf{Z}_{j}=\mathbf{W}_{1, j}$ or $\mathbf{Z}_{j}=\mathbf{W}_{2, j}$. By symmetry we can assume that $\mathrm{Z}_{j}=\mathrm{W}_{1, j}$ and we get

$$
\mathrm{Z} \cdot \mathrm{E}_{j}=\mathrm{W}_{1, j} \mathrm{E}_{j}^{2}+\sum_{k \neq j} \mathrm{Z}_{k} \mathrm{E}_{k} \cdot \mathrm{E}_{j} \leqslant \mathrm{~W}_{1} \cdot \mathrm{E}_{j} \leqslant \mathrm{~V} \cdot \mathrm{E}_{j}
$$

hence $Z \geqq V$. To conclude, we note that the coordinates of any $\mathrm{W}=\Sigma \mathrm{W}_{i} \mathrm{E}_{i} \in \mathrm{E}(\mathrm{V})$ are bounded from below since $\mathrm{W}_{i}=-\mathrm{W} \cdot \mathrm{E}_{i}^{*} \geqslant-\mathrm{V} . \mathrm{E}_{i}^{*}$ since $\mathrm{E}_{i}^{*}$ is $\geqslant 0$. Observe the obvious
(1) $[\mathrm{V}+\mathrm{W}] \leqslant[\mathrm{V}]+[\mathrm{W}] ;[\mathrm{V}+\mathrm{E}]=[\mathrm{V}]+\mathrm{E}$ if $\mathrm{E} \in \mathrm{NS}(f, \mathrm{Z})$.

We also let
(2) $[\underline{V}]=-[-\mathrm{V}]$ in such a way that $[\underline{\mathrm{V}}] \ll \mathrm{V} \leq[\mathrm{V}]$.
1.3. Let $L$ be an invertible sheaf on $\mathbb{X}$. We define
(1) $e_{f}(\mathrm{~L}) \in \operatorname{NS}(f, \mathrm{Q}) \quad$ by $e_{f}(\mathrm{~L}) \cdot \mathrm{E}_{i}=\operatorname{deg}\left(\mathrm{L} \mid \mathrm{E}_{i}\right) \quad$ for any $i$.

We also write $L \geq 0$ instead of $e_{f}(\mathrm{~L}) \geq 0$ and this means L. $\mathrm{E}_{i} \leqslant 0$ for all $i$. We will often drop the subscript $f$. Sending V to $0_{\mathrm{x}}(\mathrm{V})$ we identify $\operatorname{NS}(f, \mathbf{Z})$ to a subgroup of $\operatorname{Pic}(\widetilde{\mathrm{X}})$ and since $\mathrm{V}=e_{f}\left(0_{\tilde{\mathrm{x}}}(\mathrm{V})\right)$, $0_{\mathrm{X}}(\mathrm{V}) \geq 0$ is equivalent to $\mathrm{V} \geq 0$. Hence, when we write $\operatorname{Pic}(\tilde{\mathrm{X}})$ additively, we can safely write V in place of $0_{\mathrm{x}}(\mathrm{V})$ and $\mathrm{L}+\mathrm{V}$ in place of $L(V)=L \otimes 0_{\mathrm{x}}(V)$. We will sometimes write $[\mathrm{L}]$ insteated of $\left[e_{f}(\mathrm{~L})\right]$.
1.4. We can also give an algorithmic description of [V] as follows. Start with $\mathbf{Z} \in \mathbf{N S}(f, \mathbf{Z})$ such that $\mathbf{Z} \leqslant[V]$. For instance, if $\mathbf{V}=\Sigma \mathbf{V}_{i} \mathrm{E}_{\boldsymbol{i}}$ let $Z=\Sigma V_{i}^{\prime} \mathrm{E}_{i}$ where $\mathrm{V}_{i}^{\prime}$ is the smallest integer $\geqslant \mathbf{V}_{\boldsymbol{i}}$. If $\mathbf{Z} \neq[\mathrm{V}]$ there must exist a $i$ such that $\mathrm{Z} . \mathrm{E}_{i}>\mathrm{V} . \mathrm{E}_{i}$ and we still have $\mathrm{Z}+\mathrm{E}_{i} \leqslant[\mathrm{~V}]$. In fact, since $V \ll[V]$, we have $([V]-Z) . \quad \mathrm{E}_{i} \leqslant(\mathrm{~V}-\mathrm{Z}) . \mathrm{E}_{i}<0$, hence $([V]-Z) \geqslant E_{i}$ since $[V]-Z$ is effective with integral coefficients. We now replace $Z$ by $Z+E_{i}$ and reach $[V]$ in a finite number of steps.

Vanishing theorem 1.5. - Let $f: \tilde{\mathrm{X}} \rightarrow \mathrm{X}$ be a desingularization of a normal surface X , let $\mathrm{E}=f^{-1}(\operatorname{Singl}(f))$ and let L be an invertible sheaf on $\widetilde{\mathbf{X}}$.
(i) If $[\mathrm{L}] \geq 0$ then $\mathrm{H}_{\mathrm{E}}^{1}(\widetilde{\mathrm{X}}, \mathrm{L})=0$.
(ii) If $[\mathrm{L}] \geqslant 0$ then $f_{*}(\mathrm{~L})$ is reflexive.
(iii) Let K be the dualizing sheaf of $\tilde{\mathrm{X}}$. If $[\mathrm{K}-\mathrm{L}] \gg 0$ then $\mathbf{R}^{1} f_{*}(\mathrm{~L})=0$.
1.5.1. To prove (i) we let $\mathrm{M}=[\mathrm{L}]$ and $\mathrm{L}^{\prime}=\mathrm{L}(-\mathrm{M})$ in such a way that $\left[L^{\prime}\right]=0$ and $M \gg 0, M \in \operatorname{NS}(f, N)$. For any $V \in N S(f, N), V \neq 0$, there exists an $\mathrm{E}_{i}$ such that $\left(\mathrm{L}^{\prime}+\mathrm{V}\right) . \mathrm{E}_{i}<0$. Otherwise we would have $\mathrm{L}^{\prime}+\mathrm{V} \ll 0$ hence $\mathrm{L}^{\prime} \ll-\mathrm{V}$, hence $0=\left[\mathrm{L}^{\prime}\right] \leqslant-\mathrm{V}<0$ which is impossible. We observe that $\mathrm{E}_{i}$ must be contained in the support of V , otherwise we would have V. $\mathrm{E}_{i} \geqslant 0$, hence

$$
\left(\mathrm{L}^{\prime}+\mathrm{V}\right) \cdot \mathrm{E}_{i} \geqslant\left(\left[\mathrm{~L}^{\prime}\right]+\mathrm{V}\right) \cdot \mathrm{E}_{i}=\mathrm{V} \cdot \mathrm{E}_{i} \geqslant 0 .
$$

Furthermore, since $M \gg 0$, we have

$$
(\mathrm{L}+\mathrm{V}) \cdot \mathrm{E}_{i}=\left(\mathrm{L}^{\prime}+\mathrm{M}+\mathrm{V}\right) \cdot \mathrm{E}_{i} \leqslant\left(\mathrm{~L}^{\prime}+\mathrm{V}\right) \cdot \mathrm{E}_{i}<0
$$

As a consequence we get

$$
\begin{equation*}
\mathrm{V}-\mathrm{E}_{i} \in \mathrm{NS}(f, \mathrm{~N}) \quad \text { and } \quad(\mathrm{L}+\mathrm{V}) . \mathrm{E}_{i}<0 \tag{1}
\end{equation*}
$$

As a consequence we get $H^{0}\left(E_{i}, L(V) \mid E_{i}\right)=0$ hence the map

$$
\begin{equation*}
H^{0}\left(V-E_{i} ; L\left(V-E_{i}\right) \mid\left(V-E_{i}\right)\right) \rightarrow H^{0}(V ; L(V) \mid V) \tag{2}
\end{equation*}
$$

is surjective. By induction on $V$, we conclude that, if $[\mathrm{L}] \geq 0$, we have
(3) $\mathrm{H}^{0}(\mathrm{~V}, \mathrm{~L}(\mathrm{~V}) \mid \mathrm{V})=0$ for any $\mathrm{V} \in \mathrm{NS}(f, \mathrm{~N})$
hence $H_{E}^{1}(\tilde{\mathrm{X}} ; \mathrm{L})=\lim _{\rightarrow} \mathrm{H}^{0}(\mathrm{~V} ; \mathrm{L}(\mathrm{V}) \mid \mathrm{V})=0$. This proves (i) and we get (iii) by duality.
1.5.2. To prove (ii), we can assume that $[\mathrm{L}]=0$ since $f_{*}(\mathrm{~L})$ reflexive implies that, for any $\mathrm{V} \in \mathrm{NS}(f, \mathrm{~N})$, the map $f_{*}(\mathrm{~L}) \rightarrow f_{*}(\mathrm{~L}(\mathrm{~V}))$ is an isomorphism. Let $u: f_{*}(\mathrm{~L}) \rightarrow f_{*}(\mathrm{~L})^{v v}$ be the map from $f_{*}(\mathrm{~L})$ to it's bidual. Since L is invertible, we know that $u$ is an isomorphism over the open subset $X_{f}$ of $X$. Since $X$ is normal, we know that coker $(u)$ is finite and since $f$ is proper, this implies the existence of some $\mathrm{V} \in \mathrm{NS}(f ; \mathbf{N})$ such that $\quad f_{*}(\mathrm{~L})^{v v}=f_{*}(\mathrm{~L}(\mathrm{~V}))$. Since $[\mathrm{L}]=0$, we know that $\mathrm{H}^{0}(\mathrm{~V}, \mathrm{~L}(\mathrm{~V}) \mid \mathrm{V})=0$ hence $f_{*}(\mathrm{~L}) \rightarrow f_{*}(\mathrm{~L}(\mathrm{~V}))$ is an isomorphism and this concludes the proof.
1.5.3. We do not really need duality for surfaces to state and prove (iii). In fact, we can define
(1) $\mathrm{K}_{f} \in \operatorname{NS}(f, \mathbf{Q})$ by $\left(\mathrm{K}_{f}+\mathrm{E}_{i}\right) \cdot \mathrm{E}_{i}=-2 \chi\left(0_{\mathrm{E}_{i}}\right)$ for all $i$,
and write the hypothesis $\left[\mathrm{K}_{f}-e_{f}(\mathrm{~L})\right] \geqslant 0$. As for the proof it runs parallel to the proof of (i) and uses the fact that $H^{1}\left(E_{i}, M\right)=0$ if $M$ is an invertible sheaf on the reduced and irreducible Gorenstein curve $\mathrm{E}_{i}$ with $\operatorname{deg}(\mathrm{M})>-2 \chi\left(0_{\mathrm{E}_{i}}\right)$; details are left to the reader. We define $\mathrm{C}(f)$ and $\mathrm{C}_{+}$in $\operatorname{NS}(f, \mathrm{~N})$ by

$$
\begin{equation*}
\left[\mathrm{K}_{f}\right]=\mathrm{C}_{+}-\mathrm{C}(f) \tag{2}
\end{equation*}
$$

Observe that if we denote by $K_{\mathbb{X}}$ and $K_{X}$ the dualizing sheaves of $\tilde{X}$ and $X$ we have

$$
\begin{equation*}
\mathrm{K}_{f}=e_{f}\left(\mathrm{~K}_{\mathbf{x}}\right) \quad \text { and } \quad \mathrm{K}_{\mathbf{x}}=f_{*}\left(\mathrm{~K}_{\mathbf{x}}(\mathrm{C}(f))\right) \tag{3}
\end{equation*}
$$

The first formula comes from (1). For the second observe that $\left.\left[\mathrm{K}_{\mathrm{X}}(\mathrm{C}(f))\right]=\mathrm{K}_{\mathbf{x}}\right]+\mathrm{C}(f)=\mathrm{C}_{+} \geqslant 0$ hence its direct image is reflexive by (1.5(ii)) and coïncide with $\mathrm{K}_{\mathrm{X}}$ over $\mathrm{X}_{f}$, hence it must be $\mathrm{K}_{\mathrm{x}}$.

Corollary 1.6. - Under the hypothesis of (1.5), let L be an invertible sheaf on $\tilde{\mathrm{X}}$ such that $[\mathrm{L}]=0$. Then $f_{*}(\mathrm{~L})$ is reflexive and the map $u: \mathbf{R}^{1} f_{*}(\mathrm{~L}) \rightarrow \mathrm{H}^{1}(\mathrm{C}(f), \mathrm{L} \mid \mathrm{C}(f))$ is an isomorphism.

We know that $u$ is surjective. Let us introduce $\mathrm{V} \in \operatorname{NS}(f, \mathbf{Z})$ such that $\left[\mathrm{K}_{f}+\mathrm{C}(f)-e_{f}(\mathrm{~L})-\mathrm{V}\right]=0$. We claim that $\mathrm{V} \geqslant 0$. In fact $0=\left[\mathrm{K}_{f}+\mathrm{C}(f)-e_{f}(\mathrm{~L})-\mathrm{V}\right] \geq \mathrm{K}_{f}+\mathrm{C}(f)-e_{f}(\mathrm{~L})-\mathrm{V}$ hence $\boldsymbol{e}_{f}(\mathrm{~L})+\mathrm{V} \gg \mathrm{K}_{f}+\mathrm{C}(f)$ hence $\mathrm{V}=\left[\boldsymbol{e}_{f}(\mathrm{~L})+\mathrm{V}\right] \geqslant$ $\left[\mathrm{K}_{f}+\mathrm{C}(f)\right]=\mathrm{C}_{+} \geqslant 0$. We have a diagram

By (1.5.1(3)), the morphism $v$ is injective hence it is enough to show that $w$ is injective. This follows from $\mathbf{R}^{1} f_{*}(\mathrm{~L}(\mathrm{~V}-\mathrm{C}(f)))=0$ which comes from ( $1.5(\mathrm{iii})$ ) since $\left[\mathrm{K}_{f}-e_{f}(\mathrm{~L})-\mathrm{V}+\mathrm{C}(f)\right]=0$.

Corollary 1.7. - We have $\mathbf{R}^{1} f_{*}\left(0_{\mathrm{x}}\right) \leadsto \mathrm{H}^{1}\left(\mathrm{C}(f) ; 0_{\mathrm{C}(f)}\right)$ and $\mathbf{R}^{1} f_{*}\left(0_{\mathrm{x}}\right)=0$ is equivalent to $\mathrm{C}(f)=0$.

We get the isomorphism by (1.6) applied to $L=0_{\mathrm{d}}$. Hence $\mathrm{C}(f)=0$ implies $\mathbf{R}^{1} f_{*}\left(0_{\mathrm{x}}\right)=0$. Conversely, if $\mathbf{R}^{1} f_{*}\left(0_{\mathrm{x}}\right)=0$ and $\mathrm{C}(f) \neq 0$, we have $\chi\left(0_{C(f)}\right)>0$ which means

$$
\begin{aligned}
& 0>\left(\mathrm{K}_{\tilde{\mathrm{x}}}+\mathrm{C}(f)\right) \cdot \mathrm{C}(f)=\left(\mathrm{K}_{f}+\mathrm{C}(f)\right) \cdot \mathrm{C}(f) \\
& \geqslant\left(\left[\mathrm{K}_{f}\right]+\mathrm{C}(f)\right) \cdot \mathrm{C}(f)=\mathrm{C}_{+} \cdot \mathrm{C}(f) \geqslant 0
\end{aligned}
$$

a contradiction.

Proposition 1.8. - Let $f: \widetilde{\mathrm{X}} \rightarrow \mathrm{X}$ be a desingularization of a normal surface X and let M be a reflexive sheaf of rank one on X . There exists a pair $(\mathrm{L}, u)$ where L is an invertible sheaf on $\tilde{\mathrm{X}}$ such that $\left[e_{f}(\mathrm{~L})\right]=0$ and $u: f_{*}(\mathrm{~L})\left|\mathbf{X}_{f} \xrightarrow{\leftrightharpoons} \mathbf{M}\right| \mathbf{X}_{f}$ is an isomorphism. The pair $(\mathrm{L}, u)$ is unique up to a unique isomorphism. Furthermore $\mathrm{M}=f_{*}(\mathrm{~L})$.
1.8.1. It is clear that there exists a pair ( $\mathrm{L}^{\prime}, u^{\prime}$ ), where $\mathrm{L}^{\prime}$ is invertible on $\tilde{\mathbf{X}}$ and $u^{\prime}: f_{*}\left(\mathrm{~L}^{\prime}\right)\left|\mathbf{X}_{f} \xlongequal{\sim}\right| \mathbf{X}_{f}$ is an isomorphism. If ( $\left.\mathrm{L}^{\prime \prime}, u^{\prime \prime}\right)$ is another solution, we canonically have $\mathrm{L}^{\prime \prime}=\mathrm{L}^{\prime}(\mathrm{V}), \mathrm{V} \in \mathrm{NS}(f, \mathrm{Z})$, hence we get existence and uniqueness since $\left[e_{f}\left(\mathrm{~L}^{\prime}(\mathrm{V})\right)\right]=\left[e_{f}\left(\mathrm{~L}^{\prime}\right)\right]+\mathrm{V}$. By (1.5(ii)), $f_{*}(\mathrm{~L})$ is reflexive since $\left[e_{f}(\mathrm{~L})\right]=0$, hence $f_{*}(\mathrm{~L}) \xrightarrow{\rightarrow} \mathrm{M}$ since both are reflexive and coïncide over $\mathbf{X}_{\boldsymbol{f}}$.
1.8.2. We denote by $f^{v}(\mathbf{M})$ the invertible sheaf on $\tilde{\mathbf{X}}$ characterized by $\left[f^{v}(\mathbf{M})\right]=0$ and $f_{*}\left(f^{v}(\mathbf{M})\right)=\mathbf{M}$. We observe that we have

$$
\begin{equation*}
e_{f}\left(f^{v}(\mathbf{M})\right) \in \operatorname{NS}(f, \mathbf{Q}), \quad e_{f}\left(f^{v}(\mathbf{M})\right) \ll 0 \tag{1}
\end{equation*}
$$

but this element is not necessarily zero. However, if M is invertible, we obviously have $f^{v}(\mathrm{M})=f^{*}(\mathrm{M})$ since $e_{f}\left(f^{*}(\mathrm{M})\right)=0$. More generally, it is useful to compare $f^{v}(\mathbf{M})$ with another lifting $\tilde{\mathbf{M}}$ defined as follows

$$
\begin{equation*}
\mathbf{M}^{\prime}=f^{*}(\mathbf{M}) / \text { torsion } \quad \tilde{\mathbf{M}}=\mathbf{M}^{\prime v v}=\text { bidual of } \mathbf{M}^{\prime} \tag{2}
\end{equation*}
$$

Corollary 1.8.3. - Let M be a reflexive sheaf of rank one on X . Then $\mathrm{M}<0$ and $[\tilde{\mathrm{M}}] \leqslant 0$. We have $f^{v}(\mathrm{M})=\tilde{\mathrm{M}}(-[\tilde{\mathrm{M}}])$.

Since $\mathbf{M}^{\prime}$ is torsion free of rank one it is invertible except at finitely many closed points; hence $\tilde{\mathbf{M}}$ is invertible. To prove that $\tilde{\mathbf{M}} \ll 0$, assume that there exists $\mathrm{E}_{i}$ such that $\tilde{\mathbf{M}} . \mathrm{E}_{i}<0$. Then $f_{*}\left(\tilde{\mathrm{M}}\left(-\mathrm{E}_{i}\right)\right)=f_{*}(\tilde{\mathrm{M}})=\mathbf{M}$. In a neighborhood U of the generic point of $E_{i}$, we have $\mathbf{M}^{\prime}=\tilde{\mathbf{M}}$, hence $\tilde{\mathbf{M}}$ is generated on a possibly smaller neighborhood $U^{\prime}$ by sections of $M$, hence we cannot have $f_{*}\left(\tilde{\mathrm{M}}\left(-\mathrm{E}_{i}\right)\right)=f_{*}(\tilde{\mathrm{M}})$. By definition of $[\tilde{\mathrm{M}}]$, we get $[\tilde{\mathrm{M}}] \leqslant 0$ out of $\tilde{\mathbf{M}} \ll 0$. We deduce $f^{v}(\mathbf{M})=\tilde{\mathbf{M}}(-[\tilde{\mathbf{M}}])$ from $[\tilde{\mathbf{M}}(-[\tilde{\mathbf{M}}])]=0$.

Corollary 1.8.4. Assume that $\tilde{\mathrm{X}}$ dominates some desingularization $\mathrm{X}^{\prime}$ of X . We have $f=g h$ with $\tilde{\mathrm{X}} \xrightarrow{h} \mathrm{X}^{\prime} \xrightarrow{g} \mathrm{X}$. For any reflective sheaf of rank one M on X we have $f^{v}(\mathrm{M})=h^{*}\left(g^{v}(\mathrm{M})\right)$.

Since $\tilde{\mathrm{X}}$ and $\mathrm{X}^{\prime}$ are regular and $h$ proper and birational, we have $h_{*} h^{*}\left(g^{v}(\mathrm{M})\right)=g^{v}(\mathrm{M})$ hence $\left.f_{*} h^{*}\left(g^{v}(\mathrm{M})\right)\right)=\mathbf{M}$, hence we only have to prove that $\left[e_{f}\left(h^{*}\left(g^{v}(\mathbf{M})\right)\right]=0\right.$. We use the map

$$
\begin{equation*}
h^{*}: \mathrm{NS}(g, \mathbf{Q}) \rightarrow \mathrm{NS}(f, \mathrm{Q}) \tag{1}
\end{equation*}
$$

which preserves integrality, positivity and the intersection numbers. We still have to prove that we have, for any $\mathrm{V} \in \mathrm{NS}(g, \mathbf{Q})$

$$
\begin{equation*}
h^{*}([\mathrm{~V}])=\left[h^{*}(\mathrm{~V})\right] \tag{2}
\end{equation*}
$$

For any $\mathrm{E} \in \mathrm{NS}(f, N)$, we have $h^{*}(\mathrm{~V})$. $\mathrm{E}=\mathrm{V} \cdot h_{*}(\mathrm{E}) \geqslant[\mathrm{V}] \cdot h_{*}(\mathrm{E})=h^{*}([\mathrm{~V}]) . \mathrm{E}$, hence $h^{*}(\mathrm{~V}) \ll h^{*}([\mathrm{~V}])$, hence $\left[h^{*}(\mathrm{~V})\right] \leqslant h^{*}([\mathrm{~V}])$, in other words $h^{*}([\mathrm{~V}])=\left[h^{*}(\mathrm{~V})\right]+\mathrm{A}, \mathrm{A} \in \mathrm{NS}(f, \mathrm{~N})$.

From $h^{*}(\mathrm{~V}) \ll\left[h^{*}(\mathrm{~V})\right]$, we deduce $\mathrm{V} \leq h_{*}\left(\left[h^{*}(\mathrm{~V})\right]\right)=h_{*} h^{*}([\mathrm{~V}])-h_{*}(\mathrm{~A})$ $=[\mathrm{V}]-h_{*}(\mathrm{~A})$. By definition of $[\mathrm{V}]$, we deduce that $[\mathrm{V}] \leqslant[\mathrm{V}]-h_{*}(\mathrm{~A})$, hence $h_{*}(\mathrm{~A})=0$, hence $\mathrm{A} \in \mathrm{NS}(h, \mathbf{N})$. We get $0=h^{*}(\mathrm{~V}) . \quad \mathrm{A} \geqslant\left[h^{*}(\mathrm{~V})\right]$. $\mathrm{A}=h^{*}([\mathrm{~V}]) . \mathrm{A}-\mathrm{A}^{2}=-\mathrm{A}^{2}$, hence $\mathrm{A}=0$.

Proposition 1.9. - Let $f: \tilde{\mathrm{X}} \rightarrow \mathrm{X}$ and assume that $\mathbf{R}^{1} f_{*}\left(\mathrm{O}_{\tilde{\mathrm{X}}}\right)=0$.
(i) Let M be a reflexive sheaf of rank one on X . We have $f^{v}(\mathrm{M})=f^{*}(\mathrm{M}) /$ torsion and $\mathbf{R}^{1} f_{*}\left(f^{v}(\mathrm{~L})\right)=0$.
(ii) Let L be an invertible sheaf on $\widetilde{\mathrm{X}}$ such that $\mathrm{L}<0$. The map $f^{*} f_{*}(\mathrm{~L}) \rightarrow \mathrm{L}$ is surjective and $\mathbf{R}^{1} f_{*}(\mathrm{~L})=0$.

We first prove (ii). We let $\mathbf{M}=f_{*}(\mathrm{~L}), \mathrm{L}_{0}=\operatorname{Im}\left(f^{*}(\mathrm{M}) \rightarrow \mathrm{L}\right)$, $\mathrm{L}_{1}=$ bidual of $\mathrm{L}_{0}$ and we get $\mathrm{L}_{0} \subset \mathrm{~L}_{1} \subset \mathrm{~L}$ and $\mathbf{M} \subset f_{*}\left(\mathrm{~L}_{0}\right) \subset f_{*}\left(\mathrm{~L}_{1}\right) \subset f_{*}(\mathrm{~L})=\mathbf{M}$. Since $\mathbf{R}^{1} f_{*}\left(\mathrm{~L}_{0}\right)=0$, we get $f_{*}\left(\mathrm{~L}_{1} / \mathrm{L}_{0}\right)=0$ and this implies $\mathrm{L}_{1} / \mathrm{L}_{0}=0$ since $\mathrm{L}_{1} / \mathrm{L}_{0}$ has finite support. Let us define $\mathrm{V} \in \mathrm{NS}(f, \mathrm{~N})$ by $\mathrm{L}=\mathrm{L}_{0}(\mathrm{~V})$. We have $f_{*}(\mathrm{~L} \mid \mathrm{V})=0$, hence $\quad \chi\left(\mathrm{K}_{\mathrm{V}}\right)=\chi(\mathrm{L} \mid \mathrm{V})-\mathrm{L} . \mathrm{V}$ $=-h^{1}(\mathrm{~L} \mid \mathrm{V})-\mathrm{L} . \mathrm{V} \leqslant-\mathrm{L} . \mathrm{V}$. Since $\mathrm{L} \ll 0$, we get $-\mathrm{L} . \mathrm{V} \leqslant 0$ hence $\chi\left(O_{v}\right) \leqslant 0$, hence $V=0$ since $h^{1}\left(O_{v}\right)=0$. This means that $\mathrm{L}_{0}=\mathrm{L}$, from which $\mathbf{R}^{1} f_{*}(\mathrm{~L})=0$ follows.

To prove (i) we let $\mathrm{L}=f^{v}(\mathrm{M})$ and apply (ii) to L (see (1.8.3)); recall that $\mathrm{M} .=f_{*} f^{v}(\mathrm{~L})$ by (1.8).

As an exercise, we now deduce some well known facts about rational singularities.

Proposition 1.10.'Let $f: \widetilde{\mathrm{X}} \rightarrow \mathrm{X}$ be a desingularization and assume that $\mathbf{R}^{1} f_{*}\left(\mathrm{O}_{\mathbf{x}}\right)=0$. Let I be an ideal of $\mathrm{O}_{\mathrm{x}}$. The following conditions are equivalent
(i) I is integrally closed and $\mathrm{IO}_{\mathrm{x}}$ is invertible,
(ii) $\mathrm{I}=f_{*}\left(\left(\mathrm{IO}_{\mathbf{x}}\right)^{v v}\right)$,
(iii) There exists an effective divisor D on $\widetilde{\mathrm{X}}$, with $\mathrm{O}_{\mathrm{x}}(-\mathrm{D}) \geq 0$ such that $\mathrm{I}=f_{*}\left(\mathrm{O}_{\mathrm{x}}(-\mathrm{D})\right)$.

Furthermore, if we have (iii), we necessarily have $\mathrm{IO}_{\mathrm{x}}=\mathrm{M}_{\mathrm{x}}(-\mathrm{D})$.
If $\mathrm{IO}_{\mathrm{X}}$ is invertible, then $\widetilde{\mathrm{X}}$ dominates the normalized blowing up of I , hence $f_{*}\left(\mathrm{IO}_{\overline{\mathrm{x}}}\right)$ is the integral closure of I . Hence (i) $\Rightarrow$ (ii), since in that case $\mathrm{IO}_{\mathrm{x}}=\mathrm{IO}_{\mathrm{x}}{ }^{v v}$. Since $\left(\mathrm{IO}_{\mathrm{x}}\right)^{v v} \ll 0$, we have $\mathrm{IO}_{\mathrm{x}}{ }^{v v}=\mathrm{O}_{\mathrm{x}}(-\mathrm{D})$, with D effective (not necessarily vertical) and $\mathrm{D}>0$; hence (ii) $\Rightarrow$ (iii). If we assume (iii), then I is integrally closed and (1.9 (ii)) implies that
$\mathrm{IO}_{\tilde{\mathrm{x}}}=\mathrm{O}_{\tilde{\mathrm{x}}}(-\mathrm{D})$, hence (iii) $\Rightarrow$ (i) and we have also proven the last assertion.

It follows that we have a 1-1-correspondance between ideals I of $\mathrm{O}_{\mathrm{x}}$ which satisfy the above conditions and effective divisors $D$ on $X$ with $D \geq 0$. We have that $I$ is primary if and only if $D$ is vertical $(\operatorname{dim} f(\mathrm{D})=0)$ and I is reflexive (i.e. the ideal of a Weil divisor) if and only if $[D]=0$. Observe that ( $1.9(\mathrm{i})$ ) tells us that a reflexive I satisfy (i). Observe that if I is the maximal ideal of some closed point $x$, then we must have (ii), hence the corresponding D must be the connected component of the fundamental cycle corresponding to $x$. To complete the picture, recall Lipman's result saying that the set of ideals satisfying (i) is stable by multiplication, which means that $f_{*}\left(\mathrm{O}_{\mathrm{x}}(-\mathrm{D}-\mathrm{E})\right)$ $=f_{*}\left(\mathrm{O}_{\mathrm{x}}(-\mathrm{D})\right) f_{*}\left(\mathrm{O}_{\mathrm{x}}(-\mathrm{E})\right)$ if D and E are effective and $\mathrm{D} \gg 0, \mathrm{E} \geq 0$.

Example 1.11. - We now assume that $f: \widetilde{\mathrm{X}} \rightarrow \mathrm{X}$ is the minimal desingularization and that X is the spectrum of a local ring R with algebraically closed residue field, in such a way that $\mathrm{K}_{\tilde{X}} \ll 0$; this implies $\left[\mathrm{K}_{f}\right]=-\mathrm{C}(f)$. Assume that $\mathrm{K}_{\mathrm{x}}$ is invertible which means that R is a Gorenstein ring. Since $f^{*}\left(\mathrm{~K}_{\mathbf{x}}\right)=\mathrm{K}_{\mathfrak{X}}(\mathrm{V})$ for some vertical V and $e_{f}\left(f^{*}\left(\mathrm{~K}_{\mathrm{x}}\right)\right)=0$, we conclude that $\mathrm{V}=\mathrm{K}_{f}$, hence $\mathrm{K}_{f}$ has integral coefficients, hence $\mathrm{K}_{f}=-\mathrm{C}(f)$ and $\mathrm{K}_{\mathrm{X}}(\mathrm{C}(f))=f^{*}\left(\mathrm{~K}_{\mathrm{x}}\right) \approx \mathrm{O}_{\mathrm{X}}$.

If we have rational singularity, we know that $\mathrm{C}(f)=0$, hence $\mathrm{K}_{f}=0$, hence we get the well known result that $\mathrm{E}_{i}^{2}=-2$ for all $i$. If $C(f) \neq 0$, we still have that the dualizing sheaf $\mathrm{K}_{\mathrm{C}(f)}=\mathrm{K}_{\tilde{\mathrm{x}}}(\mathrm{C}(f)) \otimes \mathrm{O}_{\mathrm{C}(f)}$ is isomorphic to $\mathrm{O}_{\mathrm{C}(f)}$. The converse is also true, see for instance [2].

## 2. Genus formula.

2.1. Let $k$ be a field and X be a proper $k$-scheme of dimension 2 which is normal. We want to study Weil divisors of $\mathbf{X}$, or equivalently reflexive sheaves of rank one on $X$. Such a sheaf $M$ is determined by the invertible sheaf $i^{*}(\mathrm{M})$ since $\mathrm{M} \rightarrow i_{*} i^{*}(\mathrm{M})$ is an isomorphism where $i: \mathrm{X}_{\text {reg }} \rightarrow \mathrm{X}$ is the inclusion of the open set $\mathrm{X}_{\text {reg }}$ made up of regular points of $\mathbf{X}$. In other words, we study $\operatorname{Pic}\left(\mathbf{X}_{\text {reg }}\right)$. Let $f: \tilde{X} \rightarrow X$ be a desingularization of $X$, we have an exact sequence

$$
\begin{equation*}
0 \rightarrow \operatorname{NS}(f, \mathbf{Z}) \xrightarrow{a} \operatorname{Pic}(\tilde{\mathbf{X}}) \xrightarrow{b} \operatorname{Pic}\left(\mathbf{X}_{\text {reg }}\right) \rightarrow 0 \tag{1}
\end{equation*}
$$

where $a(\mathrm{D})$ is the class of $\mathrm{O}_{\mathrm{x}}(\mathrm{D})$ and $b$ is induced by the inclusion $j: \mathrm{X}_{\mathrm{reg}} \rightarrow \mathrm{X}$. The canonical lifting $f^{v}(\mathrm{M})$ of a reflexive sheaf of rank one M on X defined in (1.8.2) gives us a non-linear section of $b$. By composition with the usual map
(2) $e_{f}: \operatorname{Pic}(\tilde{\mathbf{X}}) \rightarrow \mathrm{NS}(f, \mathbf{Z})^{*} \subset \frac{1}{d} \mathrm{NS}(f, \mathbf{Z}) \subset \mathrm{NS}(f, \mathbf{Q}),(1.3)$
we get a class

$$
\begin{equation*}
e_{f}\left(f^{v}(\mathrm{M})\right) \in \frac{1}{d} \operatorname{NS}(f, \mathbf{Z}) \tag{3}
\end{equation*}
$$

which can only take a finite number of values since $\left[e_{f}\left(f^{v}(\mathrm{M})\right)\right]=0$. Of course, this is still non linear. To recover the classical linear theory of [6], we recall that, for $\mathrm{A}=\mathbf{Z}$ or $\mathbf{Q}$, the quadratic module $\mathrm{NS}(f, \mathbf{A})$ lies inside the Néron-Severi group $\operatorname{NS}(\widetilde{\mathrm{X}}, \mathrm{A})$ and we define
(4) $\operatorname{NS}(\mathrm{X}, \mathrm{A})=$ orthogonal of $\operatorname{NS}(f, \mathrm{~A})$ inside $\operatorname{NS}(\widetilde{\mathrm{X}}, \mathrm{A})$
which gives an orthogonal decomposition

$$
\begin{equation*}
\mathrm{cl}\left(f^{v}(\mathrm{M})\right)=\operatorname{cl}(\mathrm{M})+e_{f}\left(f^{v}(\mathrm{M})\right) \tag{5}
\end{equation*}
$$

inside $\operatorname{NS}(\widetilde{\mathrm{X}}, \mathbf{Q})=\mathrm{NS}(\mathbf{X}, \mathbf{Q}) \oplus \operatorname{NS}(f, \mathbf{Q})$. We also have another linear invariant
(6) $\quad d_{f}(\mathrm{M})=$ class of $e_{f}\left(f^{\prime}(\mathrm{M})\right)$ in $\mathrm{NS}(f, \mathbf{Z})^{*} / \mathrm{NS}(f, \mathbf{Z})$.

It is clear that the two linear invariants $\mathrm{cl}(\mathrm{M})$ and $d_{f}(\mathrm{M})$ can be computed with any lifting L of M , namely $\mathrm{cl}(\mathrm{M})$ is the orthogonal projection on $\mathrm{NS}(\mathrm{X}, \mathrm{Q})$ of $\mathrm{cl}(\mathrm{L})$ and $d_{f}(\mathrm{M})$ is the image of $e_{f}(\mathrm{~L})$; proof: $\mathrm{L}=f^{v}(\mathrm{M})(\mathrm{D})$ for some $\mathrm{D} \in \operatorname{NS}(f, \mathbf{Z})$. For instance, if $\mathrm{K}_{\mathrm{X}}$ and $\mathrm{K}_{\hat{\mathrm{X}}}$ are the dualizing sheaves of X and $\tilde{\mathrm{X}}$ we have an orthogonal decomposition

$$
\begin{equation*}
\mathrm{cl}\left(\mathrm{~K}_{\mathrm{x}}\right)=\mathrm{cl}\left(\mathrm{~K}_{\mathrm{x}}\right)+\mathrm{K}_{f} \tag{7}
\end{equation*}
$$

and

$$
\begin{equation*}
e_{f}\left(\mathrm{~K}_{\mathrm{x}}\right)=\mathrm{K}_{f}-\left[\mathrm{K}_{f}\right] . \tag{8}
\end{equation*}
$$

If we introduce the effective divisor $\mathrm{C}(f)=\left[\mathrm{K}_{f}\right]$ - as in (1.5.3) we know that the multi-degree of $f^{v}(\mathrm{M}) \mid \mathrm{C}(f)$ can only take a finite number of
values, hence the same holds for the length of

$$
\begin{equation*}
\mathbf{R}^{1} f_{*}\left(f^{v}(\mathbf{M})\right)=\mathrm{H}^{1}\left(\mathrm{C}(f) ; \quad f^{v}(\mathrm{M}) \mid \mathrm{C}(f)\right), \quad \text { (1.6) } \tag{9}
\end{equation*}
$$

Theorem 2.2. - Let M be a reflexive sheaf of rank one on X . We have
(1) $\chi(\mathrm{M})=\frac{1}{2}\left(\mathrm{cl}(\mathrm{M}), \mathrm{cl}(\mathrm{M})-\mathrm{cl}\left(\mathrm{K}_{\mathrm{x}}\right)\right)+\chi\left(\mathrm{O}_{\mathrm{x}}\right)+\frac{1}{2} e(\mathrm{M}) d(\mathrm{M})$
where the scalar product is computed in $\mathrm{NS}(\mathbf{X}, \mathbf{Q})$ and for any desingularization $f: \widetilde{\mathrm{X}} \rightarrow \mathrm{X}$ of X we have

$$
\begin{equation*}
e(\mathbf{M})=\left(e_{f}\left(f^{v}(\mathbf{M})\right), \quad e_{f}\left(f^{v}(\mathbf{M})\right)-\mathrm{K}_{f}\right) \tag{2}
\end{equation*}
$$

$$
\begin{align*}
d(\mathbf{M}) & =\lg \mathbf{R}^{1} f_{*}\left(f^{v}(\mathbf{M})\right)-\lg \mathbf{R}^{1} f_{*}\left(\mathrm{O}_{\mathbf{x}}\right)  \tag{3}\\
& =h^{1}\left(\mathrm{C}(f) ; f^{v}(\mathbf{M}) \mid \mathrm{C}(f)\right)-h^{1}\left(\mathrm{C}(f) ; \mathrm{O}_{\mathrm{C}(f)}\right)(1.5 .3) .
\end{align*}
$$

Proof. - Apply the usual Riemann-Roch formula to $f^{v}(\mathbf{M})=\mathrm{L}$. Since $\mathbf{M}=f_{*}\left(f^{v}(\mathbf{M})\right)$, we get

$$
\begin{aligned}
\chi(\mathrm{M}) & =\chi(\mathrm{L})+\lg \mathbf{R}^{1} f_{*}(\mathrm{~L})=\left(\mathrm{L}, \mathrm{~L}-\mathrm{K}_{\tilde{\mathrm{x}}}\right) / 2+\chi\left(\mathrm{O}_{\tilde{\mathrm{x}}}\right)+\lg \mathbf{R}^{1} f_{*}(\mathrm{~L}) \\
& =\chi\left(\mathrm{L}, \mathrm{~L}-\mathrm{K}_{\tilde{\mathrm{x}}}\right) / 2+\chi\left(\mathrm{O}_{\mathbf{x}}\right)+\lg \mathbf{R}^{1} f_{*}(\mathrm{~L})-\lg \mathbf{R}^{1} f_{*}\left(\mathrm{O}_{\mathbf{\chi}}\right)
\end{aligned}
$$

and split the scalar product $\left(\mathrm{L}, \mathrm{L}-\mathrm{K}_{\mathrm{x}}\right)$ according to the orthogonal decomposition $\operatorname{NS}(\tilde{\mathbf{X}}, \mathbf{Q})=\mathbf{N S}(\mathbf{X}, \mathbf{Q})+\mathbf{N S}(f, \mathbf{Q})$.

According to (1.8.4), the terms $e(\mathbf{M})$ and $d(\mathbf{M})$ do not depend on the choice of the desingularization. Furthermore we have

$$
\begin{equation*}
e(\mathrm{M})=\sum_{x \in \operatorname{Sing}(\mathrm{X})} e(\mathrm{M}, x), \quad d(\mathrm{M})=\sum_{x \in \operatorname{Sing}(\mathrm{X})} d(\mathrm{M}, x) \tag{4}
\end{equation*}
$$

where $e(\mathrm{M}, x)$ and $d(\mathrm{M}, x)$ are defined by replacing X by $\operatorname{Spec}\left(\mathrm{O}_{\mathrm{x}, x}\right)$, or even by $\operatorname{Spec}\left(\hat{O}_{\mathrm{x}, \mathrm{x}}\right)$ as is easily seen. Furthermore $e(\mathrm{M}, \mathrm{x})=d(\mathrm{M}, x)=0$ if M is invertible in a neighborhood of $x$. Furthermore $d(\mathbf{M}, x)=0$ if $\mathrm{O}_{\mathbf{x}, \mathrm{x}}$ is a rational singularity (1.7). We also know that $e(\mathbf{M})$ and $d(\mathbf{M})$ can only take a finite number of values.

For $n \in \mathbf{Z}$, we let $\mathbf{M}^{n}=i_{\boldsymbol{*}}\left(i^{*}(\mathbf{M})^{n}\right)=$ bidual of $\mathbf{M}^{\otimes n}$ and we have
(5) $\quad \chi\left(\mathrm{M}^{n}\right)=\frac{n^{2}}{2}(\mathrm{cl}(\mathrm{M}), \mathrm{cl}(\mathrm{M}))-\frac{n}{2}\left(\mathrm{cl}(\mathrm{M}), \mathrm{cl}\left(\mathrm{K}_{\mathrm{X}}\right)\right)$

$$
+\chi\left(\mathrm{O}_{\mathrm{x}}\right)+e\left(\mathrm{M}^{n}\right) / 2+d\left(\mathrm{M}^{n}\right)
$$

Observe that $e\left(\mathrm{M}^{n}\right)=0$ if the determinant of the intersection matrix divides $n$. In fact, in that case, we have $d_{f}\left(\mathrm{M}^{n}\right)=0$ hence $e_{f}\left(f^{v}(\mathrm{M})\right)=\left[e_{f}\left(f^{v}(\mathrm{M})\right)\right]=0$. For instance, if X is the Satake compactification of some Hilbert-Blümenthal surface and $\mathrm{M}=\mathrm{K}_{\mathrm{X}}$, we can get an a priori proof of the formula for the rank of the vector spaces $\mathrm{H}^{0}\left(\mathrm{X}, \mathrm{K}_{\mathrm{x}}^{n}\right)$ of automorphic forms [3].
