# FAMILIES OF FUNCTIONS DOMINATED BY DISTRIBUTIONS OF $\mathscr{C}$-CLASSES OF MAPPINGS 

by Goo ISHIKAWA

## Introduction.

A subsheaf $\mathscr{D}$ of the sheaf $\mathscr{E}_{\Omega}$ of $\mathbf{R}$-valued $\mathbf{C}^{\infty}$ functions over an open subset $\Omega$ in $\mathbf{R}^{\boldsymbol{n}}$ is called a sheaf of sub $\mathrm{C}^{\infty}$-rings of $\mathscr{E}_{\Omega}$ if, for each open subset $U$ of $\Omega$, for each $h_{1}, \ldots, h_{r} \in \mathscr{D}(U)$ and for each $C^{\infty}$ function $\tau$ on $\mathbf{R}^{r}$, the composition $\tau \circ\left(h_{1}, \ldots, h_{r}\right) \in \mathscr{E}_{\Omega}(\mathrm{U})$ also belongs to $\mathscr{D}(\mathrm{U})$.

Our problem is to establish certain conditions for «finite presentability » of the sheaf of sub $\mathrm{C}^{\infty}$-rings $\mathscr{D}_{f}$ of $\mathscr{E}_{\Omega}$, which will be called the family of functions dominated by the distribution of $\mathscr{C}$-classes of a $\mathbf{C}^{\infty}$ mapping $f: \Omega \rightarrow \boldsymbol{\Omega}^{\prime}$ into an open subset $\boldsymbol{\Omega}^{\prime}$ of $\mathbf{R}^{\boldsymbol{p}}$, and is defined as follows.

At first, for each point $x \in \Omega$, we take the proper ideal

$$
\mathscr{C}_{f, x}=\left(f_{1, x}-f_{1}(x), \ldots, f_{p, x}-f_{p}(x)\right) \cdot \mathscr{E}_{x}
$$

of $\mathscr{E}_{x}=\mathscr{E}_{\Omega, x}$, where $f_{i}$ is the $i$-th component of $f$. Then we define $\mathscr{D}_{f}$ by

$$
\left.\begin{array}{rlrl}
\mathscr{D}_{f}(\mathrm{U}) & =\left\{h \in \mathscr{E}_{\Omega}(\mathrm{U}) ;\right. & & \mathscr{C}_{h, x} \subseteq \mathscr{C}_{f, x},
\end{array} r \begin{array}{ll}
\text { for all } & x \in \mathrm{U}\} \\
& =\left\{h \in \mathscr{E}_{\Omega}(\mathrm{U}) ;\right.
\end{array} \quad \begin{array}{ll}
h_{x}-h(x) \in \mathscr{C}_{f, x}, & \\
\text { for all } & x \in \mathrm{x}
\end{array}\right\},
$$

for each open subset U of $\Omega$. This restriction $h \in \mathscr{D}_{f}(\mathrm{U})$ on a function $h$ is an analogue (in the case $n \leqslant p$ ) to the condition of R. Moussu-J.Cl . Tougeron [7] that $d f_{1} \wedge \cdots \wedge d f_{p} \wedge d h=0$ (on the regular locus of $f$ ) in the case $n>p$. We note that $\mathscr{D}_{f}=\mathscr{E}_{\Omega}$ if and only if $f$ is an immersion.

In [5], J. N. Mather introduced the notion of $\mathscr{C}$-equivalence of map-
germs. The ideal $\mathscr{C}_{f, x}=f_{x}^{*}\left(m_{\Omega . f(x)}\right) \cdot \mathscr{E}_{x}$ represents the contact of $\operatorname{graph}(f)$ with $\Omega \times\{f(x)\}$ at $(x, f(x))$ in $\Omega \times \Omega^{\prime}$.

Our problem is closely related to the problem of composite differentiable functions originated by G. Gleaser and treated by J.-Cl. Tougeron, J. Merrien, J. J. Risler, E. Bierstone-P. D. Milman and many authors. In fact, an interesting application of a work of J. Merrien [6] appears in § 2. However notice that our treatment of functions and mappings is local not in targets but in sources.

In § 1, we exactly formulate our result - Theorem 1.7. This theorem shows that a partial investigation of $\mathscr{D}_{f}$ is reduced to the structure of certain sheaf of ideals $\mathscr{I}_{f}$ of $\mathscr{E}_{\Omega}$ or $\mathscr{I}_{f}^{\omega}$ of $\mathcal{O}_{\Omega}$. Combined with the deep investigations on sheaves of ideals of $\mathscr{E}_{\Omega}$ by H. Whitney, B. Malgrange, J. Cl. Tougeron and many authors (cf. [4], [9]), a merit of Theorem 1.7 would come out.

We treat, in § 2, a key proposition (2.2) for the proof of Theorem 1.7. Proposition 2.2 seems to be interesting in itself.

We prove Theorem 1.7 in $\S 3$.
The author would like to thank Professors M. Adachi, S. Izumi and M. Shiota for valuable suggestions and encouragements, and would like to thank the referee for helpful advice.

## 1. Main result.

Let $\Omega$ be an open subset of $\mathbf{R}^{n}$. We denote $\mathscr{E}=\mathscr{E}_{\Omega}\left(\right.$ resp. $\left.\mathcal{O}=\mathcal{O}_{\Omega}\right)$ the sheaf of germs of $\mathbf{R}$-valued $\mathrm{C}^{\infty}$ (resp. analytic) functions on $\Omega$. Each stalk $\mathscr{E}_{x}$ of $\mathscr{E}$ is an R-algebra with the unique maximal ideal $m_{x}$, that is, germs with zero target. We write $m_{x}^{\infty}$ the ideal $\bigcap_{t \in N} m_{x}^{\prime}$ of $\infty$-flat germs. For each open subset U of $\Omega$ and each $x \in \mathrm{U}, \pi_{\mathrm{U}, x}$ means the canonical mapping $\mathscr{E}(\mathrm{U}) \rightarrow \mathscr{E}_{x}$ defined by taking of germs of functions at $x$.

Let T be a subset of $\mathscr{E}_{\Omega, x}$ for a point $x \in \Omega$. We denote $\langle\mathrm{T}\rangle$ the set of compositions $\tau \circ k$ of a $\mathbf{C}^{\infty}$ function $\tau$ on $\mathbf{R}^{r}$ with a germ $k: \Omega, x \rightarrow \mathbf{R}^{r}$ of a $\mathrm{C}^{\infty}$ mapping with components $k_{i} \in \mathrm{~T}(1 \leqslant i \leqslant r)$.

Definition 1.1. - A subset T of $\mathscr{E}_{\Omega, x}$ is called a sub $\mathrm{C}^{\infty}$-ring of $\mathscr{E}_{\Omega, x}$ if $\langle\mathrm{T}\rangle=\mathrm{T} . A \operatorname{sub} \mathrm{C}^{\infty}$-ring T of $\mathscr{E}_{\Omega, x}$ is finitely generated (resp. formally
finitely generated) if $\mathrm{T}=\left\langle k_{1}, \ldots, k_{e}\right\rangle\left(\right.$ resp. $\left.\mathrm{T} \subseteq\left\langle k_{1}, \ldots, k_{e}\right\rangle+m_{x}^{\infty}\right)$ with $a$ finite system of elements $k_{1}, \ldots, k_{e}$ of T .

Remark 1.2. - Compare the definition of sheaves of sub $\mathrm{C}^{\infty}$-rings of $\mathscr{E}_{\Omega}$ in Introduction with that of sub $\mathrm{C}^{\infty}$-rings. Futhermore, we can define the category of $\mathrm{C}^{\infty}$-rings (see [1], for example). Typical examples of $\mathrm{C}^{\infty}$ rings are $\mathscr{E}_{x}, \mathscr{F}_{x}=\mathscr{E}_{x} / m_{x}^{\infty}$ and $\mathscr{E}(\mathrm{U})(\mathrm{U}$ is an open subset of $\Omega)$. Naturally we can also define the notion of sheaves of $\mathrm{C}^{\infty}$-rings. A sheaf of sub $\mathrm{C}^{\infty}$-rings of $\mathscr{E}_{\Omega}$ is just a subobject of the sheaf of $\mathrm{C}^{\infty}$-rings $\mathscr{E}_{\Omega}$.

Let $\mathscr{D}$ be a sheaf of sub $\mathrm{C}^{\infty}$-ring of $\mathscr{E}_{\Omega}$.
Definition 1.3. - We call a subset S of $\mathrm{D}(\mathrm{U})$ for an open subset U of $\Omega$ a system of generators (resp. formal generators) of D over U if for each point $\tilde{x}$ of $\mathrm{U}, \mathscr{D}_{\tilde{x}}=\left\langle\pi_{\mathrm{U}, \tilde{x}}(\mathbf{S})\right\rangle\left(\right.$ resp $\left.. \mathscr{D}_{\tilde{x}} \subseteq\left\langle\pi_{\mathrm{U}, \tilde{x}}(\mathrm{~S})\right\rangle+m_{\tilde{x}}^{\infty}\right)$, where $\mathscr{D}_{\tilde{x}}$ is the stalk of $\mathscr{D}$ over $\tilde{x}$. We say that $\mathscr{D}$ is finitely generated (resp. formally finitely generated) as a sheaf of sub $\mathrm{C}^{\infty}$-rings at a point $q$ of $\Omega$ if $\mathscr{D}$ has a finite system of generators (resp. formal generators) over an open neighborhood of $q$ in $\Omega$.

Definition 1.4. - The sheaf of relations of elements $h_{1}, \ldots, h_{e}$ of $\mathscr{D}(\mathrm{U})$ for an open subset U of $\Omega$ is the kernel of the canonical homomorphism $\quad h^{*} \mathscr{E}_{\mathbf{R}^{e}} \rightarrow \mathscr{D}_{\mathrm{UU}}$ induced by the $\mathrm{C}^{\infty}$ mapping $h=\left(h_{1}, \ldots, h_{e}\right): \mathrm{U} \rightarrow \mathbf{R}^{e}$, which is a sheaf of ideals of $h^{*} \mathscr{E}_{\mathbf{R}^{e}}$. We say that $\mathscr{D}$ is finitely presented as a sheaf of sub $\mathrm{C}^{\infty}$-rings at a point $q$ of $\Omega$ if there exists a finite system of generators $h_{1}, \ldots, h_{e}$ over an open neighborhood U of $q$ in $\Omega$ such that the sheaf of relations of $h_{1}, \ldots, h_{e}$ is of finite type at $q$ as a sheaf of ideals of $h^{*} \mathscr{E}_{\mathbf{R}^{e}}$.

Remark 1.5. - (1) The condition that $\mathscr{D}$ is finitely generated at $q$ is different from that $\mathscr{D}_{q}$ is finitely generated.
(2) If $\mathscr{D}$ is finitely presented at $q$, then there is a natural isomorphism

$$
h^{*} \mathscr{E}_{\mathbf{R}^{e}} /\left(g_{1}, \ldots, g_{s}\right) \cdot h^{*} \mathscr{E}_{\mathbf{R}^{e}} \simeq \mathscr{D}_{U^{\prime}}
$$

(of sheaves of $\mathrm{C}^{\infty}$-rings) over an open neighborhood $\mathrm{U}^{\prime}$ of $q$, where $h=\left(h_{1}, \ldots, h_{e}\right): \mathrm{U}^{\prime} \rightarrow \mathbf{R}^{e}, \quad h_{i} \in \mathscr{D}\left(\mathrm{U}^{\prime}\right)(1 \leqslant i \leqslant e) \quad$ and $\quad g_{i} \in h^{*} \mathscr{E}_{\mathbf{R}^{e}}\left(\mathrm{U}^{\prime}\right)$ $(1 \leqslant i \leqslant s)$.

Let $\Omega$ (resp. $\Omega^{\prime}$ ) be an open subset of $\mathbf{R}^{n}\left(\right.$ resp. $\left.\mathbf{R}^{p}\right)$ and $f: \Omega \rightarrow \Omega^{\prime}$ a finite $\mathrm{C}^{\infty}$ mapping ( $f$ is finite if, for any point $x \in \Omega, \mathscr{E}_{\Omega, x}$ is a finite $\mathscr{E}_{\Omega^{\prime}, f(x)}$-module via $\left.f_{x}^{*}: \mathscr{E}_{\Omega^{\prime}, f(x)} \rightarrow \mathscr{E}_{\Omega, x}\right)$.

In order to formulate Theorem 1.7, we define an auxiliary sheaf of ideals $\mathscr{I}_{f}$ of $\mathscr{E}_{\Omega}$ from the family of ideals $\left(\mathscr{C}_{f, x}\right)_{x \in \Omega}$ (see Introduction) by

$$
\begin{equation*}
\mathscr{I}_{f}(\mathrm{U})=\bigcap_{x \in U} \pi_{\mathrm{U}, x}^{-1}\left(\Delta_{n} \mathscr{C}_{f, x}\right) \tag{1.6}
\end{equation*}
$$

for each open subset U of $\Omega$, where $\Delta_{r} \mathrm{I}(0 \leqslant r \leqslant n)$ is the $r$-th Jacobian extension of an ideal I of $\mathscr{E}_{x}$ :

$$
\Delta_{r} \mathrm{I}=\mathrm{I}+\left(\operatorname{det} \frac{\left(g_{1}, \ldots, g_{r}\right)}{\left(x_{i_{1}}, \ldots, x_{i_{r}}\right)} ; g_{i} \in \mathrm{I}, 1 \leqslant i_{1}<\cdots<i_{r} \leqslant n\right) \cdot \mathscr{E}_{x}
$$

We can regard $\mathscr{I}_{f}$ as an infinitesimal version of $\mathscr{D}_{f}$. Further we define a sheaf of ideals $\mathscr{I}_{f}^{\omega}$ of $\mathcal{O}_{\Omega}$ by

$$
\mathscr{I}_{f}^{\omega}(\mathrm{U})=\mathscr{I}_{f}(\mathrm{U}) \cap \mathcal{O}_{\Omega}(\mathrm{U}),
$$

for each open subset $U$ of $\Omega$.

Theorem 1.7. - Assume that $f$ is analytic. Then, for a point $q$ of $\Omega$ with the rank of Jacobian $d f(q) \geqslant n-1$, the following conditions are equivalent to each other :
(A) $\mathscr{I}_{f}$ is formally generated by a finite number of analytic sections over an open neighborhood of $q$ (as a sheaf of ideals of $\mathscr{E}_{\Omega}$ ).
(B) $\mathscr{D}_{f}$ is finitely generated by analytic sections at $q$ (as a sheaf of sub $\mathrm{C}^{\infty}$-rings of $\mathscr{E}_{\Omega}$ ).
(C) $\mathscr{D}_{f}$ is finitely presented by analytic sections at $q$.

Furthermore, the condition (A) is also equivalent to one of the followings:
$\left(\mathrm{A}^{\prime}\right) \mathscr{I}_{f}^{\omega}$ is of finite type at $q$ (as a sheaf of ideals of $\mathcal{O}_{\Omega}$ ).
$\left(\mathrm{A}^{\prime \prime}\right)$ For each point $\tilde{q}$ in a neighborhood of $q, \mathscr{I}_{f, \tilde{q}}$ is finitely generated as an ideal of $\mathscr{E}_{\tilde{q}}$.

In Theorem 1.7, the restriction on the rank of the Jacobian of $f$ at $q$ is essential. Without this restriction, the relation between $\mathscr{I}_{f}$ and $\mathscr{D}_{f}$ seems to disappear.

## 2. Inverse images of sheaves of ideals by a non-singular vector field.

Let $\Omega$ be an open subset of $\mathbf{R}^{n}$, D a $\mathrm{C}^{\infty}$ vector field, $\mathscr{I}$ a sheaf of ideals of $\mathscr{E}_{\Omega}$ and $q$ a point in $\Omega$. Throughout this section, we use these notations.

An element $g$ of $\mathscr{E}_{\Omega, q}$ is called $\mathrm{D}_{q}$-regular if $\left(\mathrm{D}_{q}^{k} g\right)(q) \neq 0$ for a nonnegative integer $k$, where $\mathrm{D}_{q}^{k} g$ is the element of $\mathscr{E}_{\Omega, q}$ obtained by operating $k$ times the derivation $\mathrm{D}_{q}$ to $g$.

We put, for each open subset $U$ of $\Omega$,

$$
\begin{equation*}
\left(\mathrm{D}^{-1} \mathscr{I}\right)(\mathrm{U})=\mathrm{D}^{-1}(\mathscr{I}(\mathrm{U})) \quad\left(\subseteq \mathscr{E}_{\Omega}(\mathrm{U})\right) \tag{2.1}
\end{equation*}
$$

Notice that the presheaf $\mathrm{D}^{-1} \mathscr{I}$ is a sheaf of sub $\mathrm{C}^{\infty}$-rings of $\mathscr{E}_{\Omega}$.
The following proposition treats of structure of $\mathrm{D}^{-1} \mathscr{I}$.
Proposition 2.2. - Suppose that D is non-singular at $q$, that $\mathscr{I}$ is formally generated by a finite number of analytic sections over an open neighborhood of $q$ and that $\mathscr{I}_{q}$ contains an analytic $\mathrm{D}_{q}$-regular element. Then there exists a finite system of generators $h_{1}, \ldots, h_{e} \in\left(\mathrm{D}^{-1} \mathscr{I}\right)(\mathrm{U}) \cap \mathcal{O}_{\Omega}(\mathrm{U})$ of $\mathrm{D}^{-1} \mathscr{I}$ over an open neighborhood U of $q$ with the following properties :
(1) For each open subset $\mathrm{U}^{\prime} \subseteq \mathrm{U}$ and each $\xi \in \mathrm{D}^{-1} \mathscr{I}\left(\mathrm{U}^{\prime}\right)$, there exists $a \mathrm{C}^{\infty}$ function $\tau$ on an open neighborhood of $h\left(\mathrm{U}^{\prime}\right)$ such that $\xi=\tau \circ h$ in U.
(2) The sheaf of relations of $h_{1}, \ldots, h_{e}$ is of finite type.

This proposition will be used in the proof of $(A) \Rightarrow(C)$ of Theorem 1.7.

To make the assertion of Proposition 2.2 more clear, we mention several observations.

Remark 2.3. - Suppose that D is non-singular at $q$.
(1) If $\mathrm{D}^{-1} \mathscr{I}$ is finitely generated at $q$ as a sheaf of sub $\mathrm{C}^{\infty}$-rings, then $\mathscr{I}$ is of finite type at $q$.
(2) If $\left(\mathrm{D}^{-1} \mathscr{I}\right)_{q}$ is finitely generated, then $\mathscr{I}_{q}$ is finitely generated.
(3) Suppose that $\mathscr{I}_{q} \nsubseteq m_{q}^{\infty}$. Then $\left(\mathrm{D}^{-1} \mathscr{I}\right)_{q}$ is formally finitely generated if and only if $\mathscr{I}_{q}$ contains a $\mathrm{D}_{q}$-regular element.
(4) If $\mathscr{I}_{q} \subseteq m_{q}^{\infty}$ and $\mathscr{I}_{q} \neq\{0\}$, then $\left(\mathrm{D}^{-1} \mathscr{I}\right)_{q}$ is formally finitely generated, but is never finitely generated.
(5) $\mathrm{D}^{-1}\{0\}$ is finitely generated.
(6) Even if $\mathscr{I}_{q}$ contains an analytic $\mathrm{D}_{q}$-regular element, the $\mathrm{C}^{\infty}$-ring $\left(\mathrm{D}^{-1} \mathscr{I}\right)_{q}$ is not necessarily finitely generated (see Example 3.7).

The rest of this section is devoted to the proof of Proposition 2.2.
Firstly we prepare several necessary lemmas.
Lemma 2.4. - Let $\mathrm{U}^{\prime}$ (resp. $\mathrm{V}^{\prime}$ ) be an open subset of $\mathbf{R}^{n}$ (resp. $\mathbf{R}^{e}$ ), and $\mathrm{H}^{\prime}: \mathrm{U}^{\prime} \rightarrow \mathrm{V}^{\prime}$ be a proper finite analytic mapping. Then we have

$$
\mathrm{H}^{\prime *}\left(\mathscr{E}\left(\mathrm{~V}^{\prime}\right)\right)=\mathrm{H}^{\prime *}\left(\mathscr{E}\left(\mathrm{~V}^{\prime}\right)\right)^{\wedge}
$$

where $\mathrm{H}^{*}\left(\mathscr{E}\left(\mathrm{~V}^{\prime}\right)\right)^{\wedge}$ is the set of elements $h \in \mathscr{E}\left(\mathrm{U}^{\prime}\right)$ such that, for any $y \in \mathrm{~V}^{\prime}, h-\mathrm{H}^{\prime *}(k)$ is $\infty$-flat at $\mathrm{H}^{\prime-1}(y)$ for some $k \in \mathscr{E}\left(\mathrm{~V}^{\prime}\right)$ depending on $y$.

For the proof of Lemma 2.4, see [6] and [8].
Let A denotes $\mathscr{E}_{\mathbf{R}^{n-1}, \tilde{q}^{\prime}}$ for a point $\tilde{q}^{\prime} \in \mathbf{R}^{n-1}$.
Lemma 2.5. - Let $\mathrm{P}=\sum_{j=0}^{s} b_{j} t^{s-j}$ be a polynomial with coefficients $b_{j} \in \mathrm{~A}(0 \leqslant j \leqslant s)$ and with a variable $t$. We define $\mathrm{F}_{k} \in \mathrm{~A}[t](k=0,1,2, \ldots)$ by $\partial \mathrm{F}_{k} / \partial t=t^{k} . \mathrm{P}$ and $\mathrm{F}_{k \mid t=0 ;}=0$ :

$$
\begin{equation*}
\mathrm{F}_{k}=\sum_{i=0}^{s} \frac{1}{s+k+1-i} b_{i} t^{s+k+1-i} \tag{1}
\end{equation*}
$$

If $b_{0}\left(q^{\prime}\right) \neq 0$, then there exists $\tau_{k} \in \mathscr{E}_{\mathbf{R}^{n-1+(3 s+1)}, 0}(k=0,1,2, \ldots)$ such that
(2) $\mathrm{F}_{k}=\tau_{k} \circ\left(x_{1}-x_{1}\left(\tilde{q}^{\prime}\right), \ldots, x_{n-1}-x_{n-1}\left(\tilde{q^{\prime}}\right), \mathrm{F}_{0}, \mathrm{~F}_{1}, \ldots, \mathrm{~F}_{3 s}\right)$,
(3) $\operatorname{ord}_{0} \tau_{k} \rightarrow+\infty($ as $k \rightarrow+\infty)$,
where $\operatorname{ord}_{0} \tau_{k}$ means the supremum of $r$ such that $\tau_{k, 0} \in m_{0}^{r}$.
Lemma 2.6. - Let $\mathrm{F}_{k}$ be as above. Then we have a formula
(1) $\mathrm{F}_{k} \mathrm{~F}_{u}=\sum_{i=1}^{s+1}\left(\frac{1}{k+i}+\frac{1}{u+i}\right) b_{s+1-i} \mathrm{~F}_{k+u+i}, \quad(k, u \geqslant 0, k+u \geqslant s+1)$.

Further there exist rational numbers $\beta_{k, u},(k, u \geqslant 0, k+u=m)$, for any $m$, such that
(2) $b_{0} \mathrm{~F}_{m+s+1}=\sum_{k, u \geqslant 0, k+u=m} \beta_{k, u} \mathrm{~F}_{k} \mathrm{~F}_{u}, \quad(m \geqslant 2 s)$.

Proof. - It is clear that

$$
\begin{aligned}
\partial\left(\mathrm{F}_{k} \mathrm{~F}_{u}\right) / \partial t & =\mathrm{F}_{k} \cdot t^{u} \cdot \mathrm{P}+t^{k} \cdot \mathrm{P} \cdot \mathrm{~F}_{u}=\left(\mathrm{F}_{k} \cdot t^{u}+\mathrm{F}_{u} \cdot t^{k}\right) \cdot \mathrm{P} \\
& =\sum_{i=0}^{s}\left(\frac{1}{s+k+1-i}+\frac{1}{s+u+1-i}\right) b_{i} t^{s+k+u+1-i} \mathrm{P} .
\end{aligned}
$$

Thus, integrating with $t$, we have

$$
\mathrm{F}_{k} \mathrm{~F}_{u}=\sum_{i=0}^{s}\left(\frac{1}{s+k+1-i}+\frac{1}{s+u+1-i}\right) b_{i} \mathrm{~F}_{s+k+u+1-i}
$$

which is just (1). Let $\beta_{k, u}$ be indeterminants. From (1),

$$
\sum_{k+u=m} \beta_{k, u} \mathrm{~F}_{k} \mathrm{~F}_{u}=\sum_{i=1}^{s+1}\left[\sum_{k+u=m}\left(\frac{1}{k+i}+\frac{1}{u+i}\right) \beta_{k, u}\right] b_{s+1-i} \mathrm{~F}_{m+i} .
$$

Now, if the system of equations of $\left(\beta_{k, u}\right)$

$$
\begin{aligned}
& \sum_{k+u=m}\left(\frac{1}{k+i}+\frac{1}{u+i}\right) \beta_{k, u}=0, \quad(1 \leqslant i \leqslant s), \\
& \sum_{k+u=m}\left(\frac{1}{k+s+1}+\frac{1}{u+s+1}\right) \beta_{k, u}=1,
\end{aligned}
$$

has a solution $\left(\beta_{k, u}\right)\left(\beta_{k, u} \in \mathbf{Q}\right)$, then we have the equality (2) for this solution. Hence it is sufficient to show that the $(s+1) \times(s+1)$-matrix M , $(k, i)$ component of which is $1 /(k+i-1)+1 /(m-k+i+1)$, belongs to $\mathrm{GL}(s+1, \mathbf{Q})$ when $m \geqslant 2 s$. In fact,

$$
\operatorname{det} \mathbf{M}=\prod_{t=0}^{s}\left[\frac{(t!)^{4}(m+2 t+2)!(m-t)!}{(2 t)!(2 t+1)!(m+t+1)!^{2}} \prod_{j=t}^{2 t-1}(m-j)\right]>0 .
$$

Proof of Lemma 2.5. - As $b_{0}$ is invertible in A, we have, by Lemma 2.7(2),

$$
\begin{equation*}
\mathrm{F}_{m+s+1}=\sum_{k, u \geqslant 0, k+u=m} b_{0}^{-1} \beta_{k, u} \mathrm{~F}_{k} \mathrm{~F}_{u}, \quad(m \geqslant 2 s), \tag{}
\end{equation*}
$$

for some $\beta_{k, u} \in \mathbf{Q}$. Now, for $k$ and $u$ with $k, u \geqslant 0, k+u=m$ for sufficiently large $m, F_{k}$ or $F_{u}$ can be represented as a quadratic homogeneous polynomial of $\mathrm{F}_{i}^{\prime} s$ with smaller indices $i$ with coefficients in A using $\left(^{*}\right.$ ) again. Substitute this for $F_{k}$ or $F_{u}$ in (*). If we iterate this operation, we have polynomials $\mathrm{T}_{m}(m=0,1,2, \ldots)$ such that the orders of
them increase to infinity when $m \rightarrow \infty$, and that

$$
\mathrm{F}_{m+s+1}=\mathrm{T}_{m}\left(\mathrm{~F}_{0}, \mathrm{~F}_{1}, \ldots, \mathrm{~F}_{3 s}\right), \quad(m \geqslant 2 s) .
$$

Thus if we take $\mathrm{T}_{\boldsymbol{m}}$ as $\tau_{m+s+1}$ regarding as an element of $\mathscr{E}_{\mathbf{R}^{n-1+(3 s+1), 0}}$, then the conditions (2) and (3) of Lemma 2.5 are satisfied.

To show that a certain mapping is injective, we prepare the following lemma which is not hard to see.

Lemma 2.7. - Let $\mathrm{P} \in \mathrm{C}[z]$ be a polynomial of degree $s$. Then the mapping $\varphi: \mathbf{C} \rightarrow \mathbf{C}^{s+1}$ defined by

$$
\varphi(z)=\left(\int_{0}^{z} \mathrm{P}(t) d t, \int_{0}^{z} t \mathrm{P}(t) d t, \ldots, \int_{0}^{z} t^{s} \mathrm{P}(t) d t\right)
$$

is injective.
We need a lemma on the sheaf of relations of a mapping of a certain type.

Lemma 2.8. - Let U (resp. V) be an open subset of $\mathbf{R}^{n}$ (resp. $\mathbf{R}^{p}$ ). Let $\mathrm{H}: \mathrm{U} \rightarrow \mathrm{V}$ be an analytic mapping which have a proper injective complexification $\mathrm{H}_{\mathrm{C}}: \widetilde{\mathrm{U}} \rightarrow \tilde{\mathrm{V}}$. Then the kernel of the natural homomorphism $\mathrm{H}^{*} \mathscr{E}_{\mathrm{V}} \rightarrow \mathscr{E}_{\mathrm{U}}$ (of sheaves of $\mathrm{C}^{\infty}$-rings) induced by H is of finite type as a sheaf of ideals of $\mathrm{H}^{*} \mathscr{E}_{\mathrm{V}}$.

Proof. - Since $\mathrm{H}_{\mathrm{C}}$ is proper, the direct image $\left(\mathrm{H}_{\mathrm{C}}\right)_{*}\left(\mathcal{O}_{0}\right)$ of $\mathcal{O}_{0}$ is a coherent $\mathcal{O}_{\boxed{\Sigma}}$-module. Furthermore, since the inverse images by H and $H_{C}$ of a point in $H(U)$ are coincident, it is easy to verify that $H_{*}\left(\mathcal{O}_{U}\right)$ is a coherent $\mathcal{O}_{\mathrm{V}}$-module, taking real and imaginary parts of generators of $\left(\mathrm{H}_{\mathrm{C}}\right)_{*}\left(\mathcal{O}_{0}\right)$. We take the $\mathcal{O}_{\mathrm{V}}$-homomorphism $\alpha: \mathcal{O}_{\mathrm{V}} \rightarrow \mathrm{H}_{*}\left(\mathcal{O}_{\mathrm{U}}\right)$ and the $\mathscr{E}_{\mathrm{V}}$-homomorphism $\beta: \mathscr{E}_{\mathrm{V}} \rightarrow \mathrm{H}_{*}\left(\mathscr{E}_{\mathrm{U}}\right)$ induced by H . Now ker $\alpha$, which is the sheaf of ideals of germs of analytic functions vanishing on $\mathrm{H}(\mathrm{U})$, is coherent. Thus, by a theorem of Malgrange ([4], Theorem VI.3.10), ker $\beta$ is an $\mathscr{E}_{\mathrm{V}}$-module of finite type. We consider the following commutative diagram

where $\mathscr{R}$ is the sheaf of relations of the components of H , and the second
and third columns are isomorphism of ringed-spaces over the homeomorphism $\mathrm{H}: \mathrm{U} \rightarrow \mathrm{H}(\mathrm{U})$. Hence $\mathscr{R}$ is a $\mathrm{H}^{*}\left(\mathscr{E}_{\mathrm{V}}\right)$-module of finite type.

Proof of Proposition 2.2. - There is an open neighborhood U of $q$ such that $\mathrm{D}=\partial / \partial x_{n}$ for a system of analytic coordinates $x_{1}, \ldots, x_{n}$ over U centered at $q$. From assumption, shrinking U if necessary, $\mathscr{I}$ is formally generated over $U$ by some elements $g_{1}, \ldots, g_{m} \in \mathscr{I}(\mathrm{U}) \cap \mathcal{O}_{\Omega}(\mathrm{U})$. Let $g_{0}$ be an analytic $\mathrm{D}_{q}$-regular element of $\mathscr{I}_{q}$. By the preparation theorem, we may assume that $g_{0}$ is a monic pseudopolynomial with coefficients in $\mathcal{O}(\pi(\mathrm{U}))$ of degree $s$ in $x_{n}$ after we take U smaller, where $\pi: \mathrm{U} \rightarrow \mathbf{R}^{n-1}$ is the projection to the first ( $n-1$ )components. By the division theorem,

$$
g_{i}=\mathrm{Q}_{i} g_{0}+\sum_{j=1}^{s} \mathrm{~A}_{i j} x_{n}^{s-j}, \quad(1 \leqslant i \leqslant m)
$$

for $\mathrm{Q}_{i} \in \mathcal{O}(\mathrm{U})$ and $\mathrm{A}_{i j} \in \mathcal{O}(\pi(\mathrm{U})),(1 \leqslant i \leqslant m, 1 \leqslant j \leqslant s)$, taking U smaller again if necessary. If we put

$$
\mathrm{P}_{0}=g_{0}, \quad \mathrm{P}_{i}=g_{0}+\sum_{j=1}^{s} \mathrm{~A}_{i j} s_{n}^{s-j}, \quad(1 \leqslant i \leqslant m),
$$

then $\mathrm{P}_{0}, \mathrm{P}_{1}, \ldots, \mathrm{P}_{m} \in \mathscr{I}(\mathrm{U}) \cap \mathcal{O}(\mathrm{U})$ also generate $\mathscr{I}$ over U formally, and each $P_{i}$ is of the following type :

$$
\begin{equation*}
\mathrm{P}_{i}=x_{n}^{s}+\sum_{j=1}^{s} \mathrm{~B}_{i j} x_{n}^{s-j}, \quad(0 \leqslant i \leqslant m) \tag{1}
\end{equation*}
$$

where $\quad \mathrm{B}_{i j} \in \mathcal{O}(\pi(\mathrm{U}))$.
Now we define an element $F_{i k}^{\tilde{q}}(0 \leqslant i \leqslant m, k=0,1,2, \ldots)$ of $\left(\mathrm{D}^{-1} \mathscr{I}\right)(\mathrm{U})$, for each point $\tilde{q}$ of $U$, by

$$
\left\{\begin{array}{l}
\mathrm{D}\left(\mathrm{~F}_{i k}^{\tilde{q}}\right)=\left(x_{n}-x_{n}(\tilde{q})\right)^{k} \cdot \mathrm{P}_{i},  \tag{2}\\
\mathrm{~F}_{i k \mid\left\{\mid x_{n}=x_{n}(\tilde{q})\right\}}=0 .
\end{array}\right.
$$

As $\mathrm{D}=\partial / \partial x_{n}, \mathrm{~F}_{i k}^{\tilde{q}}$ is well defined. Further we put
$\mathrm{H}^{\tilde{q}}=\left(x_{1}-x_{1}(\tilde{q}), \ldots, x_{n-1}-x_{n-1}(\tilde{q}), \quad \mathrm{F}_{i k}^{\tilde{q}}(0 \leqslant i \leqslant m, 0 \leqslant k \leqslant 3 s)\right): \mathrm{U} \rightarrow \mathbf{R}^{e}$ where $e=n-1+(m+1)(3 s+1)$, and for $\tilde{q}=q, \mathrm{H}=\mathrm{H}^{q}$. Then we shall show that
(3) : If one takes the open neighborhood $U$ of $q$ smaller if necessary, then for each open subset $U^{\prime}$ of $U$,

$$
\left(\mathrm{H}_{\mathrm{lU}}\right)^{*}\left(\mathscr{E}\left(\mathbf{R}^{e}\right)\right)^{\wedge} \supseteq \mathrm{D}^{-1} \mathscr{I}\left(\mathrm{U}^{\prime}\right)
$$

For the definition of $\left(\mathrm{H}_{\mid \mathrm{U}}\right)^{*}\left(\mathscr{E}\left(\mathbf{R}^{e}\right)\right)^{\wedge}$, see Lemma 2.4.
We will prove Proposition 2.2 supposing (3). At first we see that
(4) H is a finite analytic mapping.

This is obvious because already $\left(x_{1}, \ldots, x_{n-1}, \mathrm{~F}_{0,0}\right)$ is finite. Next we see, for a complexification $\mathrm{Hc}: \widetilde{\mathrm{U}} \rightarrow \mathbf{C}^{e}$ of H , that
(5) $H_{C}$ is injective on a neighborhood of $q$ in $\tilde{U}$.

In fact, for

$$
\Phi=\left(x_{1}, \ldots, x_{n-1}, \mathrm{~F}_{0,0}, \mathrm{~F}_{0,1}, \ldots, \mathrm{~F}_{0, s}\right),
$$

$\Phi_{\mathrm{C} . q}: \mathbf{C}^{n}, q \rightarrow \mathbf{C}^{n+s}$ has an injective representative by Lemma 2.7. Moreover since $\mathrm{H}_{\mathrm{C}}$ is finite, there exists an open neighborhood $\tilde{\mathrm{V}}$ of $\mathrm{H}_{\mathrm{C}}(\widetilde{\mathrm{U}})$ in $\mathrm{C}^{e}$ such that
(6) $\mathrm{H}_{\mathrm{C}}: \tilde{\mathrm{U}} \rightarrow \tilde{\mathrm{V}}$ is proper,
if we take $\tilde{U}$ smaller if necessary. Further for each open subset $U^{\prime}$ of $U$, there exists an open neighborhood $\mathrm{V}^{\prime}$ of $\mathrm{H}\left(\mathrm{U}^{\prime}\right)$ in $\mathbf{R}^{e}$ such that $\mathrm{H}_{\text {IU }}: \mathrm{U}^{\prime} \rightarrow \mathrm{V}^{\prime}$ is proper. Thus we can apply Lemma 2.4 to this case, and we have

$$
\left(\mathrm{H}_{\mid \mathrm{U}^{\prime}}\right)^{*}\left(\mathscr{E}\left(\mathrm{~V}^{\prime}\right)\right)=\left(\mathrm{H}_{\mid \mathrm{U}^{\prime}}\right)^{*}\left(\mathscr{E}\left(\mathrm{~V}^{\prime}\right)\right)^{\wedge}
$$

By definition,

$$
\left(\mathrm{H}_{\mid U^{\prime}}\right)^{*}\left(\mathscr{E}\left(\mathbf{R}^{e}\right)\right)^{\wedge}=\left(\mathrm{H}_{\mid \mathrm{U}^{\prime}}\right)^{*}\left(\mathscr{E}\left(\mathrm{~V}^{\prime}\right)\right)^{\wedge}
$$

From (3),

$$
\left(\mathrm{H}_{\mid \mathrm{U}}\right)^{*}\left(\mathscr{E}\left(\mathbf{R}^{e}\right)\right)^{\wedge} \supseteq\left(\mathrm{D}^{-1} \mathscr{I}\right)\left(\mathrm{U}^{\prime}\right)
$$

and since each component of $H$ belongs to $\left(\mathrm{D}^{-1} \mathscr{I}\right)(\mathrm{U})$, we have

$$
\left(\mathrm{D}^{-1} \mathscr{I}\right)\left(\mathrm{U}^{\prime}\right) \supseteq\left(\mathrm{H}_{\mid \mathrm{U}^{\prime}}\right)^{*}\left(\mathscr{E}\left(\mathrm{~V}^{\prime}\right)\right)
$$

Hence we know that

$$
\left(\mathrm{D}^{-1} \mathscr{I}\right)\left(\mathrm{U}^{\prime}\right)=\left(\mathrm{H}_{\mid \mathrm{U}^{\prime}}\right)^{*}\left(\mathscr{E}\left(\mathrm{~V}^{\prime}\right)\right)
$$

If we put all components of H as $h_{1}, \ldots, h_{e}$, then we have the first part of Proposition 2.2.

From (5) and (6), we can apply Lemma 2.8 to H. Therefore, we have the rest of Proposition 2.2.

There remains to show the assertion (3). From (5), it is sufficient to prove that
(7) $\left\{\begin{array}{l}\text { for any open subset } \mathrm{U}^{\prime} \subseteq \mathrm{U}, \text { each element } \xi \text { of } \mathrm{D}^{-1} \mathscr{I}\left(\mathrm{U}^{\prime}\right) \\ \text { satisfies, for each } \tilde{q} \in \mathrm{U}^{\prime}, \text { that } \xi \equiv \tau \circ \mathrm{H} \text { at } \tilde{q} \text { modulo } m_{\tilde{q}}^{\infty} \\ \text { with a } \mathrm{C}^{\infty} \text { function } \tau \text { on } \mathbf{R}^{e} .\end{array}\right.$

Let $\tilde{q} \in \mathrm{U}^{\prime}$. Then $(\mathrm{D} \xi)_{\tilde{q}} \in \mathscr{I}_{\tilde{q}}$. Thus there exists a system of elements $c_{1}, \ldots, c_{m}$ of $\mathscr{E}_{\tilde{q}}$ such that

$$
(\mathrm{D} \xi)_{\tilde{q}} \equiv \sum_{i=0}^{m} c_{i} \mathrm{P}_{i} \text { at } \tilde{q}, \bmod . m_{\tilde{q}}^{\infty}
$$

We denote by $\hat{c}_{i} \in \mathscr{F}_{\tilde{q}}\left(=\mathscr{E}_{\tilde{q}} / m_{\tilde{q}}^{\infty}\right)$ the Taylor series of $c_{i}$, and put

$$
\hat{c}_{i}=\sum_{k=0}^{\infty} c_{i k}\left(x^{\prime}-x^{\prime}(\tilde{q})\right) \cdot\left(x_{n}-x_{n}(\tilde{q})\right)^{k}
$$

where $x^{\prime}=\left(x_{1}, \ldots, x_{n-1}\right)$ and $c_{i k}\left(x^{\prime}-x^{\prime}(\tilde{q})\right) \in \mathscr{F}_{\mathbf{R}^{n-1}, \pi(\tilde{q})}$. We have an equality

$$
(\widehat{\mathrm{D} \xi})_{\tilde{q}}=\sum_{i=0}^{m} \sum_{k=0}^{\infty} c_{i k}\left(x^{\prime}-x^{\prime}(\tilde{q})\right) \cdot\left(x_{n}-x_{n}(\tilde{q})\right)^{k} \cdot \widehat{\mathrm{P}}_{i}
$$

in $\mathscr{F}_{\mathbf{R}^{n}, \tilde{q}}$. We expand $\mathrm{P}_{i}$ for $x_{n}-x_{n}(\tilde{q})$ and apply Lemma 2.5 , for $\tilde{q}^{\prime}=\pi(\tilde{q})$. Then there exists a system of $\mathrm{C}^{\infty}$ functions $\tau_{i k}$ $(0 \leqslant i \leqslant m, k=0,1,2, \ldots)$ on $\mathbf{R}^{e}$ such that

$$
\begin{gathered}
\mathrm{F}_{i k}^{\tilde{q}}=\tau_{i k} \circ \mathrm{H}^{\tilde{q}} \text { at } \tilde{q}, \\
\operatorname{ord}_{0} \tau_{i k} \rightarrow \infty(k \rightarrow \infty)
\end{gathered}
$$

The sum $\sum_{i=0}^{m} \sum_{k=0}^{\infty} c_{i k} \cdot \tau_{i k}$ has a meaning as an element of $\mathscr{F}_{\mathbf{R}^{e}, 0}$. Denote this $\hat{\tau}_{1}$, and take $\tau_{1} \in \mathscr{E}\left(\mathbf{R}^{e}\right)$ with $\left(\tau_{1}\right)_{0}=\hat{\tau}_{1}$.

We see that there exists a $\mathbf{C}^{\infty}$ mapping $\tau_{2}: \mathbf{R}^{e} \rightarrow \mathbf{R}^{e}$ such that

$$
\mathbf{H}^{\tilde{q}}=\tau_{2} \circ \mathbf{H} \quad \text { at } \quad \tilde{q} .
$$

In fact,

$$
\mathrm{D}_{\tilde{q}}\left(\mathrm{~F}_{i k}^{\tilde{q}}\right)=\left(x_{n}-x_{n}(\tilde{q})\right)^{k} \cdot \mathrm{P}_{i}=\sum_{j=0}^{k}\binom{k}{j}\left(-x_{n}(\tilde{q})\right)^{k-j} x_{n}^{j} \mathrm{P}_{i}
$$

thus we have that

$$
\mathrm{F}_{i k}^{\tilde{q}} \equiv \sum_{j=0}^{k}\binom{k}{j}\left(-x_{n}(\tilde{q})\right)^{k-j} \mathrm{~F}_{i j}^{q} \bmod . \operatorname{ker} \mathrm{D}_{\tilde{q}}
$$

As $\operatorname{ker} \mathrm{D}_{\tilde{q}}=\mathscr{E}_{\mathbf{R}^{n-1}, \tilde{q}} \subset \mathscr{E}_{\mathbf{R}^{n}, \tilde{q}}$, there exists a function $\eta \in \mathscr{E}\left(\mathbf{R}^{e}\right)$ such that

$$
F_{i k}^{\tilde{q}}=\eta \circ\left(x_{1}, \ldots, x_{n-1}, F_{i j}(0 \leqslant j \leqslant k)\right) .
$$

This shows the existence of $\tau_{2}$.
By the above arguments,

$$
\begin{aligned}
\widehat{\xi}_{\tilde{q}} & \equiv \sum_{i=0}^{m} \sum_{k=0}^{\infty} c_{i k}\left(x^{\prime}-x^{\prime}(\tilde{q})\right) \cdot \int\left(x_{n}-x_{n}(\tilde{q})\right)^{k} \widehat{\mathrm{P}}_{i} d x_{n}, \text { mod. ker } \mathrm{D}_{\tilde{q}} \\
& =\left(\sum_{i=0}^{m} \sum_{k=0}^{\infty} c_{i k} \hat{\tau}_{i k}\right) \cdot \mathrm{H}^{\tilde{q}} .
\end{aligned}
$$

Hence

$$
\begin{aligned}
\xi & \equiv \tau_{1} \circ \mathrm{H}^{\tilde{q}} \quad \text { at } \quad \tilde{q}, \quad \bmod .\left[\left(\operatorname{ker} \mathrm{D}_{\tilde{q}}\right)+m_{\tilde{q}}^{\infty}\right] \\
& =\tau_{1} \circ \tau_{2} \circ \mathrm{H}
\end{aligned}
$$

Thus there exists a $\mathbf{C}^{\infty}$ function $\tau$ on $\mathbf{R}^{e}$ such that

$$
\xi \equiv \tau \circ \mathbf{H} \quad \text { at } \quad \tilde{q}, \bmod . m_{\tilde{q}}^{\infty} .
$$

This proves (7), therefore (3). This completes the proof of Proposition 2.2.

## 3. Proof of Theorem 1.7.

In this section we give the proof of Theorem 1.7 owing to Proposition 2.2, and mention several notes.

Firstly we remark that, from the naturality of notions defined in $\S 1$, it is sufficient to prove Theorem 1.7 in a convenient system of coordinates.

The following observation has a key role in the proof of Theorem 1.7.

Proposition 3.1. - Let $\Omega$ be an open subset of $\mathbf{R}^{n}$, and $f: \Omega \rightarrow \mathbf{R}^{n}$ $(n \leqslant p)$ a finite $\mathrm{C}^{\infty}$ mapping of the following type :

$$
f=\left(x_{1}, \ldots, x_{n-1}, f_{n}, \ldots, f_{p}\right)
$$

Then

$$
\mathscr{D}_{f}=\left(\frac{\partial}{\partial \mathrm{x}_{n}}\right)^{-1} \mathscr{I}_{f} .
$$

Proof. - Consider the subsets of $\Omega$

$$
\mathrm{V}_{u}=\left\{q \in \Omega ; \quad\left(\partial^{j} f_{i} / \partial x_{n}^{j}\right)(q)=0, \quad(1 \leqslant j \leqslant u, n \leqslant i \leqslant p)\right\}
$$

$(u=0,1,2, \ldots)$ and a filtration of $\Omega$ :

$$
\Omega=V_{0} \supseteq V_{1} \supseteq V_{2} \supseteq \ldots \supseteq V_{u} \supseteq \cdots
$$

We see that $q \in V_{u}$ if and only if

$$
\mathscr{C}_{f, q} \subseteq\left(x_{1}-x_{1}(q), \ldots, x_{n-1}-x_{n-1}(q),\left(x_{n}-x_{n}(q)\right)^{u+1}\right) \cdot \mathscr{E}_{q}
$$

and that this condition is equivalent to that

$$
\Delta_{n} \mathscr{C}_{f, q} \subseteq\left(x_{1}-x_{1}(q), \ldots, x_{n-1}-x_{n-1}(q),\left(x_{n}-x_{n}(q)\right)^{u+1}\right) \cdot \mathscr{E}_{q}
$$

Hence we have immediately explicite discriptions of $\mathscr{I}_{f}$ and $\mathscr{D}_{f}$ :
(3.1.1.) $\mathscr{I}_{f}(\mathrm{U})$

$$
=\left\{k \in \mathscr{E}_{\Omega}(\mathrm{U}) ; \frac{\partial^{u} k}{\partial x_{n}^{u}} \text { vanishes on } \mathrm{V}_{u+1},(u=0,1,2, \ldots)\right\}
$$

(3.1.2) $\quad \mathscr{D}_{f}(\mathrm{U})$

$$
=\left\{h \in \mathscr{E}_{\Omega}(\mathrm{U}) ; \frac{\partial^{u+1} h}{\partial x_{n}^{u+1}} \text { vanishes on } \mathrm{V}_{u+1},(u=0,1,2, \ldots) .\right\}
$$

for each open subset $U$ of $\Omega$. Thus we have in particular that

$$
\mathscr{D}_{f}=\left(\partial / \partial \mathrm{x}_{n}\right)^{-1} \mathscr{I}_{f} .
$$

Proof of the first half of Theorem 1.7. - Let $q \in \Omega$ with rank $d f(q) \geqslant n-1$. There are systems of analytic coordinates on open neighborhoods of $q$ and $f(q)$ respectively such that $f$ is of type as in Proposition 3.1. Thus, it is sufficient to prove in the case of Proposition 3.1 and $q=0$.

Put $\mathrm{D}=\partial / \partial x_{n}$. We see that $\mathscr{I}_{f, 0}$ contains an analytic $\mathrm{D}_{0}$-regular element. In fact, as $f$ is finite, $f_{i}\left(0, x_{n}\right)-f_{i}(0,0)$ is not identically zero, for some $i,(n \leqslant i \leqslant p)$. For such $i, f_{i} \in \mathscr{D}_{f}(\Omega)=\mathrm{D}^{-1} \mathscr{I}_{f}(\Omega)$ by Lemma 3.1, and the element $\left(\mathrm{D} f_{i}\right)_{0} \in \mathscr{I}_{f, 0}$ is analytic and $\mathrm{D}_{0}$-regular.

Thus we can apply Proposition 2.2 to the case $\mathscr{I}=\mathscr{I}_{f}$, and we have the implication $(A) \Rightarrow(C)$. Obviously $(C) \Rightarrow(B)$. For $(B) \Rightarrow(A)$, we refer to Remark 2.3 (1).

So as to complete the proof of Theorem 1.7, we proceed to consider the conditions ( A ), ( $\mathrm{A}^{\prime}$ ) and ( $\mathrm{A}^{\prime \prime}$ ) of Theorem 1.7 in a rather general framework.

Let $\Omega$ be an open subset in $\mathbf{R}^{n}$. Let $\mathscr{M}$ be a subsheaf of $\mathscr{E}_{\Omega}$-modules of $\mathscr{E}_{\Omega}^{\ell}$. We define a subsheaf of $\mathcal{O}_{\Omega}$-modules $\mathscr{M}^{\omega}$ of $\mathcal{O}_{\Omega}^{\prime}$ by

$$
\mathscr{M}^{\omega}(\mathrm{U})=\mathscr{M}(\mathrm{U}) \cap \mathcal{O}_{\Omega}(\mathrm{U})
$$

for each open subset $U$ of $\Omega$.
Now we introduce the following seven conditions for $\mathscr{M}$ :
(A1) For any point $x \in \Omega$, there exist sections $g_{1}, \ldots, g_{r}$ of $\mathscr{M}^{\omega}$ over an open neighborhood U of $x$ such that $g: \mathcal{O}_{\mathrm{U}}^{\boldsymbol{r}} \rightarrow \mathscr{M}^{\omega} \mid \mathrm{U}$ is surjective, that is, $\mathscr{M}^{\omega}$ is of finite type.
(A2) For any point $x \in \Omega, \mathscr{M}_{x}=\mathscr{M}_{x}^{\omega} \cdot \mathscr{E}_{\Omega, x}$.
(A3) For any point $x \in \Omega, \mathscr{M}_{x} \subseteq \mathscr{M}_{x}^{\omega} \cdot \mathscr{E}_{\Omega, x}+\mathscr{E}_{\Omega, x} \cdot m_{\Omega, x}^{\infty}$.
(A4) For any point $x \in \Omega$, there exist sections $g_{1}, \ldots, g_{r}$ of $\mathscr{M}$ over an open neighborhood U of $x$ such that $g: \mathscr{E}_{\mathrm{U}} \rightarrow \mathscr{M}_{I U}$ is surjective, that is, $\mathscr{M}$ is of finite type.
(A5) For any point $x \in \Omega$, the $\mathscr{E}_{\Omega, x}$-module $\mathscr{M}_{x}$ is finitely generated.
(A6) For any open subset U of $\Omega, \mathscr{M}(\mathrm{U})$ is closed in $\mathscr{E}_{\Omega}^{\prime}(\mathrm{U})$ with respect to the $\mathrm{C}^{\infty}$ topology.
(A) For any point $x \in \Omega$, there exist an open neighborhood $U$ of $x$ and a finite number of elements $g_{1}, \ldots, g_{r}$ of $\mathscr{M}^{\omega}(\mathrm{U})$ such that for any
point $\tilde{x} \in U$,

$$
\mathscr{M}_{\tilde{x}} \subseteq\left(g_{1, \tilde{x}}, \ldots, g_{r, \tilde{x}}\right) \cdot \mathscr{E}_{\Omega, \tilde{x}}+\mathscr{E}_{\Omega, \tilde{x}}^{\ell} \cdot m_{\Omega, \tilde{x}}^{\infty}
$$

Proposition 3.2. - The following conditions for a subsheaf of $\mathscr{E}_{\Omega}$-modules $\mathscr{M}$ of $\mathscr{E}_{\Omega}^{\ell}$ are equivalent to each other :
$(\mathrm{A}),(\mathrm{A} 1) \&(\mathrm{~A} 3),(\mathrm{A} 1) \&(\mathrm{~A} 2),(\mathrm{A} 2) \&(\mathrm{~A} 6),(\mathrm{A} 2) \&(\mathrm{~A} 5) \&(\mathrm{~A} 6)$, (A3) \& (A5) \& (A6), (A2) \& (A4).

Though this proposition is a collection of known results, we give an outline of the proof to assure ourself.

Proof. - As $\mathscr{F}_{x}$ is faithfully flat over $\mathcal{O}_{x}$, we have the implication $(\mathrm{A}) \Rightarrow(\mathrm{A} 1)$ (cf. [4], III.4). Trivially (A) implies (A3). A theorem of Malgrange ([4] Theorem VI.1.1') verifies (A1) \& (A3) $\Rightarrow$ (A2) and (A1) \& (A2) $\Rightarrow(\mathrm{A} 6)$. Obviouly (A2) implies (A3) and (A5). For (A3) \& (A5) \& (A6) $\Rightarrow(\mathrm{A} 2)$, we discuss by induction using the fact that, under the condition (A6), if $\mathscr{M}_{x}$ is generated by $g_{1}, \ldots, g_{r-1}, g_{r}$ over $\mathscr{E}_{x}$ and formally generated by $g_{1}, \ldots, g_{r-1}$, then $g_{1}, \ldots, g_{r-1}$ generates $\mathscr{M}_{x}$ over $\mathscr{E}_{x}$, according to the idea of [3] Lemma 27. The implication (A2) \& (A5) \& (A6) $\Rightarrow(\mathrm{A} 2) \&(A 6)$ is trivial. For (A2) \& (A6) $\Rightarrow(\mathrm{A} 1)$, we use a method of Tougeron (see [4] Theorem VI.3.10, for example). Clearly

$$
\begin{gathered}
(\mathrm{A} 1) \&(\mathrm{~A} 2) \Rightarrow(\mathrm{A} 1) \&(\mathrm{~A} 3) \Rightarrow(\mathrm{A}), \\
(\mathrm{A} 1) \&(\mathrm{~A} 2) \Rightarrow(\mathrm{A} 4) \quad
\end{gathered} \text { and } \quad(\mathrm{A} 2) \&(\mathrm{~A} 4) \Rightarrow(\mathrm{A}) .
$$

Thus we have required equivalences of the seven conditions.
Remark 3.3. - (1) If $f$ is finite (more generally, if the ideal $\Delta_{n} \mathscr{C}_{f, q}$ contains $m_{\Omega, q}^{\infty}$ for all $q \in \Omega$ ), then $\mathscr{I}_{f}(\mathrm{U})$ (see (1.6)) is closed in $\mathscr{E}_{\Omega}(\mathrm{U})$ for each open subset $U$ of $\Omega$. Thus in this case the condition (A6) is satisfied for $\mathscr{M}=\mathscr{I}_{f}$.
(2) The condition (A), ( $\mathrm{A}^{\prime}$ ) and ( $\mathrm{A}^{\prime \prime}$ ) in Theorem 1.7 are (A), (A1) and (A5) respectively for $\mathscr{M}=\mathscr{I}_{f}$ in an open neighborhood of $q$.

Let us consider the condition (A3) for $\mathscr{I}_{f}$.
Let $\mathscr{J}$ be a coherent sheaf of ideals of $\mathcal{O}_{\Omega}$, and D an analytic vector field over $\Omega$. We define a sheaf of ideals $\mathscr{J}_{\mathrm{D}, r}(r=0,1,2, \ldots)$ of $\mathscr{E}_{\Omega}$ by

$$
\mathscr{J}_{\mathrm{D}, r}(\mathrm{U})=\left\{k \in \mathscr{E}_{\Omega}(\mathrm{U}) ; \mathrm{V}\left(\mathrm{D}^{i} k\right) \supseteq \mathrm{V}\left(\sum_{j=0}^{i} \mathrm{D}^{j} \mathscr{J}\right), 0 \leqslant i \leqslant r\right\},
$$

for each open subset U of $\Omega$, where $\sum_{j=0}^{i} \mathrm{D}^{j} \mathscr{J}$ is a coherent sheaf of ideals defined by

$$
\left(\sum_{j=0}^{i} \mathrm{D}^{j} \mathscr{J}\right)(\mathrm{U})=\left(\sum_{j=0}^{i} \mathrm{D}^{j}(\mathscr{J}(\mathrm{U}))\right) \cdot \mathscr{E}(\mathrm{U})
$$

for each open subset U of $\Omega$, and $\mathrm{V}($.$) is the zero locus. Notice that$ $\mathscr{J}_{\mathrm{D}, 0}$, which is independent of D , is the sheaf of germs of $\mathrm{C}^{\infty}$ functions vanishing on the zero locus of $\mathscr{J}$. Further we put, for each open subset $\mathrm{U} \subseteq \Omega$,

$$
\mathscr{J}_{\mathrm{D}, r}^{\infty}(\mathrm{U})=\mathscr{J}_{\mathrm{D}, r}(\mathrm{U}) \cap \mathcal{O}_{\Omega}(\mathrm{U}) .
$$

Lemma 3.4. - With the same notation as above, we have

$$
\mathscr{J}_{\mathrm{D}, r, x} \subseteq \mathscr{J}_{\mathrm{D}, r, x}^{\infty} \cdot \mathscr{E}_{x}+m_{x}^{\infty}, \quad(r=0,1,2, \ldots)
$$

for each point $x \in \Omega$.
Remark 3.5. - Let $f: \Omega \rightarrow \boldsymbol{\Omega}^{\prime}$ be a finite analytic mapping, and $q \in \boldsymbol{\Omega}$ a point with rank $d f(q) \geqslant n-1$. Then, by (3.1.1), we know that $\mathscr{I}_{f}=\mathscr{J}_{\mathrm{D}, r}, \mathscr{J}=\left(\mathrm{D} f_{1}, \ldots, \mathrm{D} f_{p}\right) . \mathcal{O}$, for some D and $r$ locally at $q$. Thus, for such $\mathscr{I}_{f}$, the condition (A3) is satisfied.

Proof of Lemma 3.4. - We will show that $\mathscr{J}_{\mathrm{D}, r, x} . \mathscr{F}_{x}=\mathscr{J}_{\mathrm{D}, r, x}^{\omega} . \mathscr{F}_{x}$ by the induction on $r$, where $\mathscr{F}_{x}=\mathscr{E}_{x} / m_{x}^{\infty}$ and, by the natural homomorphisms $\mathcal{O}_{x} \rightarrow \mathscr{E}_{x} \rightarrow \mathscr{F}_{x}$, we regard $\mathscr{F}_{x}$ as $\mathcal{O}_{x}$-module and $\mathscr{E}_{x^{-}}$ module. In the case $r=0$, the assertion follows from a theorem of Malgrange ([4] Theorem VI.3.5.) which states that $\mathscr{J}_{\mathrm{D}, 0, x}^{\omega} \cdot \mathscr{F}_{x}$ equals to the set of infinite jets of germs of $\mathrm{C}^{\infty}$ functions vanishing on the zero locus of $\mathscr{J}$.

Assume $r>0$. We consider an exact sequence

$$
0 \rightarrow \mathscr{\mathscr { V }}_{\mathrm{D}, r, x}^{\omega} \rightarrow \mathscr{J}_{\mathrm{D}, r-1, x}^{\omega} \xrightarrow{\psi} \mathcal{O}_{x}\left(\sum_{j=0}^{r} \mathrm{D}^{j} \mathscr{J}\right)_{\mathrm{D}, 0, x}^{\infty}
$$

where $\psi(k)$ is defined to be $\mathrm{D}_{x}^{r}(k)$ modulo $\left(\sum_{j=0}^{r} \mathrm{D}^{j} \mathscr{J}\right)_{\mathrm{D}, 0, x}^{\infty}$ for each $k \in \mathscr{J}_{\mathrm{D}, r-1, x}^{\omega}$. Note that $\psi$ is certainly a homomorphism of $\mathcal{O}_{x}$-modules.

Now we have a commutative diagram
$0 \rightarrow \mathscr{J}_{\mathrm{D}, r, x}^{\omega} \otimes \mathscr{F}_{x} \rightarrow \mathscr{J}_{\mathrm{D}, r-1, x}^{\omega} \otimes \mathscr{F}_{x} \xrightarrow{\psi \otimes \mathscr{F}_{x}}\left(\mathcal{O}_{x}\left(\left(\sum_{j=0}^{r} \mathrm{D}^{j} \mathscr{J}\right)_{\mathrm{D}, 0, \mathrm{x}}^{\omega}\right) \otimes \mathscr{F}_{x}\right.$

where $\hat{\psi}$ is defined by $\hat{\psi}(k)=\hat{\mathrm{D}}_{x}^{r}(k)$ modulo $\left(\sum_{j=0}^{r} \mathrm{D}^{j} \mathscr{J}\right)_{\mathrm{D}, 0, x}^{\omega} . \mathscr{F}_{x}$ for each $k \in \mathscr{J}_{\mathrm{D}, r-1, x}^{\omega} . \mathscr{F}_{x}\left(\subseteq \mathscr{F}_{x}\right)$. Since $\mathscr{F}_{x}$ is flat over $\mathcal{O}_{x}$, in the above diagram, the first row is exact and each column is isomorphic. Using the equality in the case $r=0$, we have

$$
\left(\sum_{j=0}^{r} \mathrm{D}^{j} \mathscr{J}\right)_{\mathrm{D}, 0, x}^{\omega} . \mathscr{F}_{x}=\left(\sum_{j=0}^{r} \mathrm{D}^{j} \mathscr{J}\right)_{\mathrm{D}, 0, x} . \mathscr{F}_{x},
$$

and by the assumption of induction,

$$
\mathscr{J}_{\mathrm{D}, r-1, x}^{\omega} \cdot \mathscr{F}_{x}=\mathscr{J}_{\mathrm{D}, r-1, x} \cdot \mathscr{F}_{x}
$$

Clearly $\mathscr{J}_{\mathrm{D}, r, x} . \mathscr{F}_{x}$ is contained in the kernel of $\hat{\psi}$. Hence we have that

$$
\mathscr{J}_{\mathrm{D}, r, x} . \mathscr{F}_{x} \subseteq \mathscr{J}_{\mathrm{D}, r, x}^{\omega} . \mathscr{F}_{x}
$$

and the reverse inclusion is obvious. Now the inclusion of Lemma 3.4 follows immediately from the equality $\mathscr{J}_{\mathrm{D}, r, x} \cdot \mathscr{F}_{x}=\mathscr{J}_{\mathrm{D}, r, x}^{\omega} \cdot \mathscr{F}_{x}$.

Proof of the second half of Theorem 1.7. - Let $f$ and $q$ be as in Theorem 1.7. By Remark 3.3.(1) and Remark 3.5, the conditions (A6) and (A3) are satisfied for $\mathscr{M}=\mathscr{I}_{f}$ on an open neighborhood of $q$. Thus, by Proposition 3.2, the three conditions (A), (A1) and (A5) for $\mathscr{M}=\mathscr{I}_{f}$ in an neighborhood of $q$ are equivalent to each other. Hence, by Remark 3.3.(2), we have that the three conditions (A), ( $\mathrm{A}^{\prime}$ ) and ( $\mathrm{A}^{\prime \prime}$ ) in Theorem 1.7 are equivalent to each other.

Theorem 1.7 is now proved completely.
Here is a case where the equivalent conditions of Theorem 1.7 are satisfied.

Corollary 3.6. - Let $f: \Omega \rightarrow \Omega^{\prime}$ be a finite analytic mapping. If the 1jet extension $j^{1} f: \Omega \rightarrow \mathrm{J}^{1}\left(\Omega, \Omega^{\prime}\right)$ of $f$ is transverse to $\Sigma^{1}\left(\Omega, \Omega^{\prime}\right)$ except at
isolated points and $j^{1} f(\Omega) \subseteq \Sigma^{0}\left(\Omega, \Omega^{\prime}\right) \cup \Sigma^{1}\left(\Omega, \Omega^{\prime}\right)$, then $\mathscr{D}_{f}$ is finitely presented (at any point in $\Omega$ ).

Proof. - According to Theorem 1.7, it is sufficient to show that the condition ( $\mathrm{A}^{\prime}$ ) of Theorem 1.7 is satisfied at any point in $\Omega$, that is, $\mathscr{I}_{f}^{\omega}$ is of finite type. We reduce $f$ to the form $f=\left(x_{1}, \ldots, x_{n-1}, f_{n}, \ldots, f_{p}\right)$ on an open neighborhood $U$ of each point $q \in \Omega$ by an analytic change of coordinates. Then we have

$$
\mathscr{I}_{f \mid \mathrm{U}}^{\omega}=\left(\left(\frac{\partial f_{n}}{\partial x_{n}}, \frac{\partial f_{n+1}}{\partial x_{n}}, \ldots, \frac{\partial f_{p}}{\partial x_{n}}\right) \cdot \mathcal{O}_{\mathrm{U}}\right)_{\frac{\partial}{\partial x_{n}, r}}, \quad(r \gg 0),
$$

with the same notation as in Lemma 3.4. At each point $q$ of the zero locus of $\partial f_{n} / \partial x_{n}, \ldots, \partial f_{p} / \partial x_{n}$, the transversality condition means that $\operatorname{grad}\left(\partial f_{n} / \partial x_{n}\right)(q), \ldots, \operatorname{grad}\left(\partial f_{p} / \partial x_{n}\right)(q)$ are linearly independent. Thus $\mathscr{I}_{f l \mathrm{U}}^{\omega}=\left(\partial f_{n} / \partial x_{n}, \ldots, \partial f_{p} / \partial x_{n}\right) \cdot \mathcal{O}_{n}$ outside isolated points. At each exceptional point $q \in \mathrm{U}$, we take a finite system of generators $g_{1}, \ldots, g_{r}$ of the ideal $\mathscr{I}_{f, q}^{\omega}$ and take analytic representatives $\tilde{g}_{1}, \ldots, \tilde{g}_{r} \in \mathscr{I}_{f}^{\omega}\left(\mathrm{U}^{\prime}\right)$ of $g_{1}, \ldots, g_{r}$ respectively over an open neighborhood $U^{\prime}$ of $q$ in $U$. Then we have

$$
\mathscr{I}_{f \mid U^{\prime}}^{\omega}=\left(\frac{\partial f_{n}}{\partial x_{n}}, \ldots, \frac{\partial f_{p}}{\partial x_{n}}, g_{1}, \ldots, g_{r}\right) \cdot \mathcal{O}_{U^{\prime}}
$$

This completes the proof.
There is an example in which the conditions of Theorem 1.7 are not satisfied.

Example 3.7. - Let

$$
f=\left(x_{1}, x_{2}, x_{3}^{3}-3 x_{1} x_{2}^{2} x_{3}\right): \mathbf{R}^{3} \rightarrow \mathbf{R}^{3}
$$

The singular locus of this polynomial mapping $f$ is the Whitney's umbrella. By (3.1.1), we have that $\mathscr{I}_{f}^{\omega}(\mathrm{U})$ is the set of functions $k \in \mathcal{O}_{\mathbf{R}^{3}}(\mathrm{U})$ such that $\quad k(x)=0 \quad$ if $\quad x_{3}^{2}-x_{1} x_{2}^{2}=0 \quad$ and $\quad\left(\partial k / \partial x_{3}\right)(x)=0 \quad$ if $x_{3}=x_{1} x_{2}=0$, for each open subset $U$ of $\mathbf{R}^{3}$. It is easy to see that $\mathscr{I}_{f}^{\omega}$ is not of finite type at 0 . Thus $\mathscr{D}_{f}$ is not finitely generated. Furthermore the ideal $\mathscr{I}_{f, 0}$ is not finitely generated and $\mathscr{D}_{f, 0}=\left(\partial / \partial x_{3}\right)^{-1} \mathscr{I}_{f, 0}$ is not finitely generated by Remark 2.3.(2) and Proposition 3.1.
