# ON THE FAMILY RELATION FOR ARTINIAN RINGS 

by<br>K. R. Pearson

In [4] (see also [5], Chapter III), Kruse and Price introduced the notion of two rings being in the same family. This was motivated by the relation of group isoclinism introduced by P. Hall in [3].

Rings $R_{1}$ and $R_{2}$ are said to be in the same family, denoted by $R_{1} \stackrel{F}{\leftrightarrow} R_{2}$, if there exist isomorphisms $\phi: R_{1} / \mathfrak{H}\left(R_{1}\right) \rightarrow R_{2} / \mathscr{H}\left(R_{2}\right)$ and $\psi: R_{1}^{2} \rightarrow R_{2}^{2}$ such that
(1) if $\left(r_{i}+\mathfrak{H}\left(R_{1}\right)\right) \phi=s_{i}+\mathfrak{Y}\left(R_{2}\right)$ for $i=1,2$ then $\left(r_{1} r_{2}\right) \psi=s_{1} s_{2}$.

Here $\mathfrak{H}(R)$ denotes the annihilator of a ring $R$ and is defined by

$$
\mathfrak{A}(R)=\{x \in R \mid x r=r x=0 \text { for all } r \in R\} .
$$

$\stackrel{F}{\leftrightarrow}$ is an equivalence relation which is identical with isomorphism if either $R_{i}^{2}=R_{i}$ for $i=1,2$ or $\mathfrak{A}\left(R_{1}\right)=\mathfrak{A}\left(R_{2}\right)=0$.

Also, if $R_{1} \stackrel{F}{\leftrightarrow} R_{2}$, then $R_{1}$ is nilpotent if and only if $R_{2}$ is nilpotent. We show below how the family relation for commutative Artinian rings reduces to isomorphism between certain subrings equal to their own square and the family relation for certain nilpotent factor rings. We first need the following proposition.

Proposition. If $R_{1} \stackrel{F}{\leftrightarrow} R_{2}$ then, for all integers $m \geqq 2, R_{1}^{m} \cong R_{2}^{m}$ and $R_{1} / R_{1}^{m} \stackrel{F}{\leftrightarrow} R_{2} / R_{2}^{m}$.

Proof. Let $\phi: R_{1} / \mathfrak{H}\left(R_{1}\right) \rightarrow R_{2} / \mathfrak{H}\left(R_{2}\right)$ and $\psi: R_{1}^{2} \rightarrow R_{2}^{2}$ be isomorphisms such that (1) holds. Because of (1) it is clear that, for all $m \geqq 2$, the restriction of $\psi$ to $R_{1}^{m}$ is an isomorphism onto $R_{2}^{m}$.

Suppose $m \geqq 2$. For $i=1,2$ let $V_{i}=R_{i} / R_{i}^{m}, \alpha_{i}: R_{i} \rightarrow V_{i}$ be the canonical map and

$$
L_{i}=\left\{x \in R_{i} \mid\left(x R_{i}\right) \cup\left(R_{i} x\right) \subseteq R_{i}^{m}\right\} .
$$

Then $\mathfrak{A}\left(R_{i}\right) \subseteq L_{i}$ and $\mathfrak{A}\left(V_{i}\right)=L_{i} / R_{i}^{m}$. Because $\psi \alpha_{2}$ maps $R_{1}^{2}$ onto $R_{2}^{2} / R_{2}^{m}=V_{2}^{2}$ and has kernel $R_{2}^{m} \psi^{-1}=R_{1}^{m}, \psi$ induces an isomorphism $\Psi: V_{1}^{2} \rightarrow V_{2}^{2}$ given by

$$
\left(x+R_{1}^{m}\right) \Psi=x \psi+R_{2}^{m} \quad \text { for } x \in R_{1}^{2} .
$$

For $i=1,2$ let $\beta_{i}$ be the map from $R_{i} / \mathcal{H}\left(R_{i}\right)$ onto $R_{i} / L_{i}$ given by

$$
\left(r_{i}+\mathfrak{Y}\left(R_{i}\right)\right) \beta_{i}=r_{i}+L_{i} \quad r_{i} \in R_{i}
$$

and let $\gamma_{i}$ be the isomorphism from $R_{i} / L_{i}$ onto $V_{i} / \mathfrak{A}\left(V_{i}\right)$ given by

$$
\left(r_{i}+L_{i}\right) \gamma_{i}=\left(r_{i}+R_{i}^{m}\right)+\mathfrak{H}\left(V_{i}\right)
$$

Then $\phi \beta_{2} \gamma_{2}$ maps $R_{1} / \mathfrak{H}\left(R_{1}\right)$ onto $V_{2} / \mathfrak{H}\left(V_{2}\right)$ and has kernel $\left(L_{2} / \mathfrak{Y}\left(R_{2}\right)\right) \phi^{-1}$. But because of (1) this equals $L_{1} / \mathfrak{H}\left(R_{1}\right)$ which is also the kernel of $\beta_{1} \gamma_{1}$. Hence $\phi$ induces an isomorphism $\Phi$ from $V_{1} / \mathfrak{A}\left(V_{1}\right)$ onto $V_{2} / \mathfrak{H}\left(V_{2}\right)$ given by

$$
\left(\left(r_{1}+L_{1}\right) \gamma^{-1}\right) \Phi=\left(r_{1}+9\left(R_{1}\right)\right) \phi \beta_{2} \gamma_{2} \quad r_{1} \in R_{1}
$$

Finally it is easy to check that $\Phi$ and $\Psi$ satisfy the compatability condition corresponding to (1) and hence $V_{1} \stackrel{F}{\leftrightarrow} V_{2}$.

If $R$ is a ring with D.C.C. on two-sided ideals (in particular, if $R$ is Artinian), there is a least positive integer $n$ such that $R^{m}=R^{n}$ for all $m \geqq n$. We denote $R^{n}$ by $K(R)$. Then, of course, $K(R)^{2}=K(R)$ and $R / K(R)$ is nilpotent.

Suppose $R_{1}$ and $R_{2}$ are two rings with D.C.C. on twosided ideals. If $R_{1} \stackrel{F}{\leftrightarrow} R_{2}$ it follows from the proposition that $K\left(R_{1}\right) \cong K\left(R_{2}\right)$ and $R_{1} / K\left(R_{1}\right) \stackrel{F}{\leftrightarrow} R_{2} / K\left(R_{2}\right)$. That the converse is not true may be seen by considering the (non-commutative) 4 dimensional algebra $R$ over the field with two elements and with basis $e, a, b, c$ where multiplication is such that all products of the basis elements are zero except that $e e=e$, $e a=a, e b=b$ and $a c=b$. Then it is easy to check that $R$ is associative, $R^{2}$ is the subspace with basis $e, a, b, K(R)=R^{2}, \mathfrak{Y}(R)=0=\mathfrak{Y}\left(R^{2}\right)$. Hence $K(R)=K\left(R^{2}\right), R / K(R) \stackrel{F}{\hookrightarrow} R^{2} / K\left(R^{2}\right)$ but $R$ and $R^{2}$ are not in the same family.

However, suppose in addition that $R_{1}$ and $R_{2}$ are commutative. Then, if $J_{i}$ is the Jacobson radical of $R_{i}$, there exists an idempotent $e_{i} \in R_{i}$ such that $e_{i}+J_{i}$ is the identity of $R_{i} / J_{i}$ and, if $T_{i}=\left\{x-x e_{i} \mid x \in R_{i}\right\}$, $R_{i}=R_{i} e_{i}+T_{i}$ and $T_{i} \subseteq J_{i}$ is nilpotent ([1], Theorem 9.3 C). Since $R_{i} e_{i}$ is a ring with identity $e_{i},\left(R_{i} e_{i}\right)^{m}=R_{i} e_{i}$ for all $m \geqq 1$ and so, since $T_{i}$ is nilpotent, $K\left(R_{i}\right)=R_{i} e_{i}$. Hence $R_{i}=K\left(R_{i}\right) \oplus T_{i}$ and $R_{i} / K\left(R_{i}\right) \cong$ $T_{i}$. Thus if $K\left(R_{1}\right) \cong K\left(R_{2}\right)$ and $R_{1} / K\left(R_{1}\right) \stackrel{F}{\leftrightarrow} R_{2} / K\left(R_{2}\right)$ then also $T_{1} \stackrel{F}{\leftrightarrow} T_{2}$ and so clearly $R_{1} \stackrel{F}{\leftrightarrow} R_{2}$. This proves the following.

Theorem. Let $R$ and $S$ be rings with D.C.C. on two-sided ideals. If $R \stackrel{F}{\leftrightarrow} S$ then $K(R) \cong K(S)$ and $R / K(R) \stackrel{F}{\leftrightarrow} S / K(S)$. If, in addition, $R$ and $S$ are commutative, the converse is also true.

Finally if $R_{1} \stackrel{F}{\leftrightarrow} R_{2}$ then it is clear that $R_{1} / J_{1} \cong R_{2} / J_{2}$. (Indeed, if $\mathscr{H}$ is any radical property (see [2], Chapter 1) such that every ring whose square is zero is an $\mathscr{H}$-ring and if $\mathscr{H}(R)$ denotes the $\mathscr{H}$-radical of a ring $R$ then from $R_{1} / \mathscr{H}\left(R_{1}\right) \cong R_{2} / \mathfrak{H}\left(R_{2}\right)$ it follows that $R_{1} / \mathscr{H}\left(R_{1}\right) \cong$ $R_{2} / \mathscr{H}\left(R_{2}\right)$ since $\mathfrak{A}\left(R_{i}\right) \subseteq \mathscr{H}\left(R_{i}\right)$.) But if $R_{i}$ is a commutative Artinian ring then $J_{i}$ is the direct sum of the radical of $K\left(R_{i}\right)$ and $T_{i}$. Hence if $R_{1} \stackrel{F}{\leftrightarrows} R_{2}$ and each $R_{i}$ is commutative and Artinian, then $R_{1} / J_{1} \cong R_{2} / J_{2}$ and $J_{1} \stackrel{F}{\leftrightarrow} J_{2}$. That the converse is however false can be seen by considering $R_{1}$ as the ring of integers modulo 4 and $R_{2}$ the algebra over the field with two elements with basis 1 and $x$ and with $x^{2}=0$.
