# The eta invariant and the equivariant unitary bordism of spherical space form groups 

PETER B. GILKEY<br>Math. Dept. Univ. Oregon, Eugene, OR 97403, USA

Received 26 September 1986; accepted in revised form 31 July 1987

#### Abstract

The eta invariant of Atiyah et al is a $\mathbb{R} / \mathbb{Z}$ valued invariant of equivariant unitary bordism completely detecting $M U *(B G)$ for spherical space form groups $G$. We use the eta invariant to compute the additive structure of $M U *\left(B Q_{2}\right)$ for $Q_{2}=\{ \pm 1, \pm i, \pm j, \pm k\}$. MOS 58G12 (primary) 57R85 (secondary).

## 0. Introduction

Let $G$ be a finite group with classifying space $B G . G$ is a spherical space form group if there exists a fixed point free representation $\tau: G \rightarrow U(k)$ for some $k$. We assume henceforth $G$ is such a group; these groups have been classified by Wolf [13]. Let $M U *(B G)$ and $M \operatorname{Spin}^{c} *(B G)$ be the reduced equivariant unitary and Spinc bordism groups. If $A$ is an Abelian group, let $A_{(p)}$ denote the $p$-primary torsion of $A$. The Anderson-Brown-Peterson splitting expresses $M \operatorname{Spin}^{c} *(B G)_{(2)}$ in terms of homology and in terms of connective $K$-theory $b u *$; see $[3,4,7]$ for details:

$$
\begin{aligned}
M \operatorname{Spin}^{c} *(B G)_{(2)}= & b u *(B G)_{2} \otimes \mathbb{Z}\left[x_{4}, x_{8}, \ldots\right] \\
& \oplus \tilde{H} *\left(B G ; \operatorname{Tor}\left(\tilde{\Omega}_{*}^{\text {spinc }}\right)\right) .
\end{aligned}
$$

The corresponding splitting of the spectrum $M U$ at any prime or $M \operatorname{Spin}^{c}$ at odd primes is in terms of the Brown-Peterson homology $B P *$ and not $b u *$ :

$$
M U *(B G)_{(p)}=\left\{\mathbb{Z}\left[x_{2 i} \mid i \neq p^{v}-1\right]\right\} \otimes B P *(B G)
$$

so [3, 4, 7] do not give $M U *(B G)_{(2)}$. We conjecture nevertheless:
Conjecture 0.1: There exists an additive splitting

$$
M U *(B G) \cong b u *(B G) \otimes \mathbb{Z}\left[x_{4}, x_{6}, \ldots\right]
$$

The Sylow subgroups of $G$ are given as follows. Let $\mathbb{Z}_{n}=\left\{\lambda \in \mathbb{C}\right.$ : $\left.\lambda^{n}=1\right\}$ be the cyclic group of order $n$ and let $\varrho_{s}(\lambda)=\lambda^{s}$ be the irreducible representations of $\mathbb{Z}_{n}$ for $0 \leqslant s<n ; \varrho_{s}: \mathbb{Z}_{n} \rightarrow U(1)$ is fixed point free for $s$ coprime to $n$ so $\mathbb{Z}_{n}$ is a spherical space form group. Identify $S U(2)$ with the unit sphere $S^{3}$ of the quaternions. Any finite subgroup $G$ of $S^{3}$ is fixed point free. If $m \geqslant 2$, let $Q_{m} \subseteq S^{3}$ be the group of order $2^{m+1}$ generated by $\left\{\cos \left(2 \pi / 2^{m}\right)+i \cdot \sin \left(2 \pi / 2^{m}\right), j\right\}$ and let $\tau_{0}: Q_{m} \mapsto S U(2)$ be the natural embedding; $Q_{2}=\{ \pm 1, \pm i, \pm j, \pm k\}$. Let $H_{p}$ be a $p$-Sylow subgroup of $G$. $H_{p}$ is cyclic if $p$ is odd and either cyclic or one of the $Q_{m}$ for $p=2$.

There is one other group we shall need. Embed the alternating group $A_{4}$ on 4 letters as the orientation preserving isometries of the tetrahedron. The 2-fold cover of $A_{4}$ in $S U(2)$ is a group with 24 members isomorphic to the special linear group of $2 \times 2$ matrices on the field with 3 elements $S L(2,3)$. This group may be identified with $\{ \pm 1, \pm i, \pm j, \pm k,( \pm 1 \pm i \pm j \pm k) / 2\} \subseteq S U(2)$.

We will use the eta invariant to study $M U *(B G)$. Let $R(G)$ be the group representation ring of $G$ and let $R_{0}(G)$ be the augmentation ideal. Let $R(U)$ be the (stable) group representation ring of the unitary group. If $M \in$ $M U *(B G)$ and if $\theta \in R_{0}(G) \otimes R(U)$, let $\eta(\theta, M) \in \mathbb{R} / \mathbb{Z}$ be the eta invariant of the tangential operator of the Dolbeault complex on $M$ with coefficients in the bundle $\theta(M)$ defined by $\theta$; see $[1,8]$. The map $M \rightarrow \eta(\theta, M)$ extends to a map in bordism $\eta: M U *(B G) \otimes R_{0}(G) \otimes R(U) \mapsto \mathbb{R} / \mathbb{Z}$ taking values in $\mathbb{Q} / \mathbb{Z}$ as $M U *(B G)$ is finite in each dimension. We will prove in section 2

Theorem 0.2: If $M \in M U *(B G)$ and $\eta(\theta, M)=0 \forall \theta \in R_{0}(G) \otimes R(U)$, $M=0$.

We also refer to a similar result by Wilson [12]. The Hattori-Stong theorem plays an essential role in the proof and Theorem 0.2 is the generalization of the Hattori-Stong theorem to equivariant unitary bordism.

The connective $K$-theory groups $b u *$ can be computed in terms of the representation theory. If $G$ is cyclic,

$$
b u_{2 k-1}\left(B \mathbb{Z}_{n}\right) \cong R_{0}\left(\mathbb{Z}_{n}\right) / R_{0}\left(\mathbb{Z}_{n}\right)^{k+1} \cong \tilde{K}\left(S^{2 k+1} / \mathbb{Z}_{n}\right)
$$

If G is quaternionic, let $I=\left(2-\tau_{0}\right) \cdot R\left(Q_{m}\right) \subseteq R_{0}\left(Q_{m}\right)$. We showed in [7]

$$
b u_{4 k-3}\left(B Q_{m}\right)=R_{0}\left(Q_{m}\right) / I^{k} \cong \tilde{K}\left(S^{4 k-1} / Q_{m}\right) \text { and } b u_{4 k-5}\left(B Q_{m}\right)=I / I^{k}
$$

If $G=\mathbb{Z}_{p}$ for $p$ prime, 0.1 follows from arguments of Conner-Floyd [5]. We have constructed an analytic proof for $G=\mathbb{Z}_{4}$ and $G=\mathbb{Z}_{9}$. Bendersky and Davis [2] proved 0.1 for cyclic groups which proves 0.1 at the prime $p$
if $H_{p}$ is cyclic (which is always the case if $p$ is odd). Mesnaoui [11] has studied $B P *\left(B Q_{m}\right)$ in terms of the Gysin sequence. We will prove in sections 3 and 4:

Theorem 0.3:
(a) $b u_{1}(\operatorname{BSL}(2,3))=0$. If $k>1$, $b u_{4 k-3}(B S L(2,3))_{(2)} \cong b u_{4 k-5}(B S L(2,3))_{(2)} \cong \mathbb{Z}_{2^{2 k-1}} \otimes \mathbb{Z}_{2^{k-2}}$
(b) $b u_{1}\left(B Q_{2}\right)=\mathbb{Z}_{2} \oplus \mathbb{Z}_{2}$. If $k>1$,
$b u_{4 k-3}\left(B Q_{2}\right) \cong b u_{4 k-3}(B S L(2,3))_{(2)} \oplus \mathbb{Z}_{2^{k}} \oplus \mathbb{Z}_{2^{k}}$ and $b u_{4 k-5}\left(B Q_{2}\right) \cong b u_{4 k-5}(B S L(2,3))_{(2)} \oplus \mathbb{Z}_{2^{k-1}} \oplus \mathbb{Z}_{2^{k-1}}$.
(c) If $G=S L(2,3)$ or $G=Q_{2}, M U *(B G)_{(2)}=b u *(B G)_{(2)} \otimes \mathbb{Z}\left[x_{4}, x_{6}, \ldots\right]$.

Remark: If $H_{2}=Q_{2}$, and $X *=\tilde{H}, M U *, b u *$, or $B P *$, then

$$
\begin{aligned}
& X *(B G)_{(2)} \cong X *\left(B Q_{2}\right) \text { if } H_{1}(B G ; \mathbb{Z}) \neq 0 \\
& X *(B G)_{(2)} \cong X *(B S L(2,3)) \text { if } H_{1}(B G ; \mathbb{Z})=0
\end{aligned}
$$

so this proves conjecture 0.1 at the prime 2 if $H_{2}=Q_{2}$.
We believe the analytic approach we shall use to prove Theorem 0.3 is of independent interest since it has a very different flavor from the standard topological methods.*

It is a pleasant task to acknowledge the help and encouragement of $A$. Bahri at every step of the way. We also acknowledge the suggestions of the referee in shaping the final form of this paper and the help of G. Seitz.

## 1. Topological preliminaries

If $\varrho \in R(G)$ and $M \in M U *(B G)$, let $\varrho(M)$ be the associated vector bundle; extend this by linearity to define ring homomorphisms $\pi: R(G) \mapsto K(M)$ and $\pi: R_{0}(G) \mapsto \tilde{K}(M)$. If $\tau: G \rightarrow U(k)$ is fixed point free, let $N(G, \tau)=$ $S^{2 k-1} / \tau(G)$. The underlying real bundle of $\pi(\tau)$ is $T(N(G, \tau)) \oplus 1$ so $N(G, \tau)$ inherits a natural stable complex structure. Since $N(G, \tau)$ is odd dimensional, it bounds in $M U *$ so $N(G, \tau)$ belongs to the reduced group $M U *(B G)$.

Let $X(-)$ be one of the functors $\tilde{H}, M U, b u$, or $B P$ and let $X$ be the associated coefficient ring:

$$
\begin{aligned}
M U * & =\mathbb{Z}\left[x_{2 i}: i=1,2, \ldots\right] \\
B P * & =\mathbb{Z}\left[x_{2} ; j=p^{v}-1 \quad \text { for } v=1,2, \ldots\right], b u *=\mathbb{Z}\left[x_{2}\right] .
\end{aligned}
$$

[^0](If $X=\tilde{H}$, let the coefficient ring be $\mathbb{Z}$ ). There is a slight notational difficulty, here since by $X(-)$ we mean the reduced theory while the coefficient ring is the un-reduced theory evaluated at a point, but in practice this causes no problems. If $X=M U, B P$, or $b u$, there is a spectral sequence for $X *(B G)$ with $E_{p, q}^{2}$ term $\tilde{H}_{p}\left(B G ; X_{q}\right)$. By Landweber [10], all the differentials in the spectral sequence vanish. This is the crucial topological fact we shall use to derive information for these functors from information about $\tilde{H}$. For example, $\tilde{H}_{\text {even }}(B G ; \mathbb{Z})=0$ implies $X_{\text {even }}(B G)=0$.

Let $H$ be a subgroup of $G$. Induction and transfer define maps

$$
i: X *(B H) \rightarrow X *(B G) \text { and } t: X *(B G) \rightarrow X *(B H)
$$

We need to study $i$ and $t$ in some detail on $M U *$. Let $A, B \subseteq G$; we wish to describe $t_{A} \cdot i_{B}\{N(B, \tau)\}$ in terms of double cosets. Let $B \mapsto S^{2 k-1} \mapsto$ $N(B, \tau)$ be the left principal $B$-bundle defining the $B$-structure on $N(B, \tau)$. Then $G \mapsto G \times{ }_{B} S^{2 k-1} \mapsto N(B, \tau)$ is the left-principal $G$-bundle defining $i_{B}(N(B, \tau))$ and $A \mapsto G \times{ }_{B} S^{2 k-1} \mapsto A \backslash\left\{G \times{ }_{B} S^{2 k-1}\right\}$ is the left-principal $A$ bundle defining $t_{A} \cdot i_{B}(N(B, \tau))$. Induction changes the total space but not the base while transfer changes the base but not the total space. Decompose $G=U_{i} A g_{i} B$ into double cosets. Let $A_{i}=g_{i} \cdot B \cdot g_{i}^{-1} \cap A$ and let $\tau_{i}(a)=$ $\tau\left(g_{i}^{-1} \cdot a \cdot g_{i}\right): A_{i} \mapsto U(k)$. The connected components of $A \backslash\left\{G \times{ }_{B} S^{2 k-1}\right\}$ are $S^{2 k-1} / \tau_{i}\left(A_{i}\right)$ and the total space is $A \times_{A(\mathrm{i})} S^{2 k-1}$. This proves:

Lemma 1.1: Let $A, B \subseteq G$ and $\tau: B \mapsto U(k)$. Let $\left\{g_{i}\right\}$ be representatives for the double cosets $A \backslash G / B$. Let $A_{i}=g_{i} \cdot B \cdot g_{i}^{-1} \cap A$ and $\tau_{i}(a)=\tau\left(g_{i}^{-1} \cdot a \cdot g_{i}\right)$. Then $t_{A} \cdot i_{B}\{N(B, \tau)\}=\Sigma_{i} i_{A} \cdot N\left(A_{i}, \tau_{i}\right)$.

Let $N_{G}\left(H_{p}\right)=\left\{g \in G: g \cdot H_{p} \cdot g^{-1}=H_{p}\right\}$ be the normalizer of the $p$-Sylow subgroup. Let aut $\left(H_{p}\right)$ be the group of automorphisms and let $m$ : $N_{G}\left(H_{p}\right) \mapsto$ aut $\left(H_{p}\right)$ by $m(g) h=g h g^{-1}$. Any automorphism of $H_{p}$ induces an automorphism of $X *\left(B H_{p}\right)$; let $m_{X}: N_{G}\left(H_{p}\right) \mapsto$ aut $\left(X *\left(B H_{p}\right)\right)$.

Lemma 1.2: Let $X *(-)=\tilde{H}(-; \mathbb{Z}), M U *(-), B P *(-)$, or $b u *(-)$.
(a) $\left|X_{a}(B G)\right|=\Pi_{b+c=a}\left|\tilde{H}_{b}(B G ; \mathbb{Z})\right|^{\mathrm{rank}_{\mathbb{Z}}(X c)}$.
(b) $\tilde{H}_{2 k}\left(B \mathbb{Z}_{n} ; \mathbb{Z}\right)=0, \quad \tilde{H}_{2 k+1}\left(B \mathbb{Z}_{n}\right)=\mathbb{Z}_{n}$, $\tilde{H}_{2 k}\left(B Q_{m} ; \mathbb{Z}\right)=0, \quad \tilde{H}_{4 k+1}\left(B Q_{m}\right)=\mathbb{Z}_{2} \oplus \mathbb{Z}_{2}, \tilde{H}_{4 k+3}\left(B Q_{m}\right)=\mathbb{Z}_{2^{m+1}}$, $\tilde{H}_{2 k}(B S L(2,3) ; \mathbb{Z})=0, \tilde{H}_{4 k+1}(B S L(2,3))=\mathbb{Z}_{3}, \tilde{H}_{4 k+3}(B S L(2,3))=\mathbb{Z}_{24}$.
(c) $\{i \cdot N(H, \sigma)\}$ for $H \subseteq G$ and $\sigma$ a fixed point free representation of $H$ generates $M U *(B G)$ as an $M U *$ module.
(d) $i: X *\left(B H_{p}\right) \mapsto X *(B G)_{(p)}$ is $1-1 ; t: X *(B G)_{(p)} \mapsto X *\left(B H_{p}\right)$ is onto.
(f) $t\left\{X *(B G)_{(p)}\right\} \subseteq\left\{y \in X *\left(B H_{p}\right): m_{X}(g) \cdot y=y \forall g \in N_{G}\left(H_{p}\right)\right\}$. If equality holds for $X *=\tilde{H}$, it follows for the other functors.

Proof: (a) follows from Landweber [10] since the spectral sequence has trivial differentials. (b) is an easy calculation using characteristic classes and is therefore omitted. If $M \in M U *(B G)$, let $\mu(M) \in \tilde{H}(B G ; \mathbb{Z})$ be the image of the fundamental class. Since $\{\mu(i \cdot N(H, \tau)\}$ generate $\tilde{H}(B G ; \mathbb{Z})$, (c) follows. $\tilde{H} *\left(B H_{p} ; \mathbb{Z}\right)$ and hence $X *\left(B H_{p}\right)$ is $p$-primary. Since $i \cdot t$ is multiplication by $\left|G: H_{p}\right|$ on $\tilde{H}$, (d) follows for $X *=\tilde{H} *$ and hence for the other functors as the relevant spectral sequences degenerate. Since transfer commutes with group isomorphism and since conjugation by $g$ is inner on $G$,

$$
t(X *(B G)) \subseteq\left\{y \in X *\left(B H_{p}\right): m_{X}(g) \cdot y=y \forall g \in N_{G}\left(H_{p}\right)\right\}
$$

We now suppose equality for $X=\tilde{H}$. To prove equality for the other functors, we recall some facts from representation theory. Let $A$ be an Abelian $p$-group and let $m_{A}: B \mapsto$ aut $(A)$. Define

$$
A^{0}=\left\{a \in A: m_{A}(b) \cdot a=a \forall b \in B\right\}
$$

and

$$
A^{1}=\operatorname{span}_{\mathbb{Z}}\left\{\left(m_{A}(b)-1\right) \cdot a\right\}_{b \in B, a \in A}
$$

If $\left|m_{A}(B)\right|$ is coprime to $p, A=A^{0} \oplus A^{1}$ is a direct sum decomposition of $A$ into the invariant and non-invariant pieces.

If $h \in H$, then $m_{X}(h)=1$ since $h$ acts by inner automorphisms. This implies $\left|m_{X}\left(N_{G}\left(H_{p}\right)\right)\right|=\left|m_{X}\left(N_{G}\left(H_{p}\right) / H_{p}\right)\right|$ is coprime to $p$. We split $X *\left(B H_{p}\right)$ and the bordism spectral sequence for $X *\left(B H_{p}\right)$ as above. Since $\tilde{H} *(B G$; $\mathbb{Z})_{(p)} \cong \tilde{H} *\left(B H_{p} ; \mathbb{Z}\right)^{0}, \mathrm{t}$ is an isomorphism from $E_{p, q}^{2}\left(B H_{p}\right)^{0}$. Therefore t is an isomorphism from $X *(B G)_{(p)}$ to $X *\left(B H_{p}\right)^{0}$.

The Smith homomorphism is used to perform induction on the dimension. Let $\tau: G \rightarrow U(k)$ be fixed point free. Embed $N(G, j \cdot \tau)$ in $N(G,(j+1) \cdot \tau)$ by embedding $C^{2 k j}$ in $C^{2 k(j+1)}$ using the first $2 k j$ coordinates. The classifying space $B G=\operatorname{LIM}_{j \mapsto \infty} N(G, j \cdot \tau)$. If $M \in M U_{*}(G)$, let $f: M \rightarrow N(G,(j+1) \cdot \tau)$ be the classifying space for $j$ large. Make $f$ transverse to $N(G, j \cdot \tau)$ and let $\Delta_{\tau}(M)=f^{-1}(N(G, j \cdot \tau)) ; \Delta_{\tau}$ is a well defined $M U *$ module morphism called the Smith homomorphism. As $\Delta_{\tau}\left(i\left(N\left(H, \tau \oplus \tau_{1}\right)\right)\right)=i\left(N\left(H, \tau_{1}\right)\right)$, $\Delta_{\tau}$ is onto by Lemma 1.2. Conner-Floyd [5] discuss the Smith homomorphism for $M S O *(B G)$ at odd primes; the situation here is similar. This proves

Lemma 1.3: $\Delta_{\tau}$ extends as an $M U *$ module morphism

$$
\Delta_{\tau}: M U_{v}(B G) \rightarrow M U_{v-2 k}(B G) \rightarrow 0
$$

## 2. The eta invariant

If $M \in M U *$ and if $\psi \in R(U)$, let index $(\psi, M) \in \mathbb{Z}$ be the index of the Dolbeault complex with coefficients in $\psi$; this is a bordism invariant. In particular the arithmetic genus $a g(M)$ is index $(1, M)$. If $\Lambda^{i}$ is the $i$ th exterior representation and if det is the determinant representation, then $R(U)=$ $\mathbb{Z}\left[\Lambda^{i}\right.$, det, $\left.\operatorname{det}^{-1}\right]$ modulo the obvious relations.

We study the eta invariant on Cartesian products as follows. Let $s\left(\Lambda^{i}\right)=$ $\oplus_{j+k=i} \Lambda^{j} \otimes \Lambda^{k}$ define a comultiplication on $R(U)$. If $\psi \in R(U)$, decompose $s(\psi)=\Sigma_{i} \psi_{1, i} \otimes \psi_{2, i}$. If $M=M_{1} \times M_{2}$ for $M_{v} \in M U *$, then $\psi(M)=$ $\oplus_{i} \psi_{1, i}\left(M_{1}\right) \otimes \psi_{2, i}\left(M_{2}\right)$. We refer to [7, Lemma 4.3.6] for the proof of:

Lemma 2.1: If $M_{1} \in M U *(B G)$ and $M_{2} \in M U *$, let $M=M_{1} \times M_{2}$. If $\theta \in$ $R_{0}(G) \otimes R(U)$, let $(1 \otimes s)(\theta)=\Sigma_{i} \theta_{i} \otimes \psi_{i}$. Then $\eta(\theta, M)=\Sigma_{i} \eta\left(\theta_{i}, M_{1}\right) \cdot$ index $\left(\psi_{i}, M_{2}\right)$. If $\varrho \in R_{0}(G), \eta(\varrho, M)=\eta\left(\varrho, M_{1}\right) \cdot a g\left(M_{2}\right)$.

The eta invariant is closely related to $R(G)$. Embed $R(G)$ in the class functions $C(G)$ and let $\left(f_{1}, f_{2}\right)_{G}=|G|^{-1} \cdot \Sigma_{g \in G} f_{1}(g) \cdot f_{2}(g)$ define a nondegenerate symmetric bilinear form on $C(G)$. Restriction $r: C(G) \mapsto C(H)$ and induction ind: $C(H) \mapsto C(G)$ are dual; $\left(f_{1} \text {, ind }\left(f_{2}\right)\right)_{G}=\left(r\left(f_{1}\right), f_{2}\right)_{H}$ by Frobenius reciprocity if $f_{1} \in C(G)$ and $f_{2} \in C(H)$. If $\tau$ is fixed point free, let

$$
\begin{aligned}
& \alpha(\tau)=\operatorname{det}(\tau-I) / \operatorname{det}(\tau) \in R_{0}(G) \text { and } \\
& \beta(\tau)(g)=\alpha(\tau)^{-1}(g) \text { for } g \neq 1 \text { and } \beta(\tau)(1)=0 ; \beta \in C(G)
\end{aligned}
$$

We note $\beta(\tau) \cdot \alpha(\tau) \cdot \varrho=\varrho$ for $\varrho \in R_{0}(G)$. Finally define

$$
\operatorname{ker}(\eta, G)=\left\{M \in M U *(B G): \eta(\theta, M)=0 \forall \theta \in R_{0}(G) \otimes R(U)\right\}
$$

Lemma 2.2: Let $H \subseteq G$.
(a) If $\varrho \in R_{0}(G)$, then $\eta(\varrho, N(G, \tau))=(\varrho, \beta(\tau))_{G}$.
(b) If $M \in M U *(B H)$ and $\theta \in R_{0}(G) \otimes R(U), \eta(\theta, i(M))=\eta((r \otimes 1) \theta, M)$.
(c) If $M \in M U *(B G)$ and $\theta \in R_{0}(H) \otimes R(U), \eta(\theta, t(M))=\eta(($ ind $\otimes 1)$ $\theta, M)$.
(d) $i: \operatorname{ker}(\eta, H) \mapsto \operatorname{ker}(\eta, G)$ and $t: \operatorname{ker}(\eta, G) \mapsto \operatorname{ker}(\eta, H)$.
(e) $\Delta_{\tau}: \operatorname{ker}(\eta, G) \mapsto \operatorname{ker}(\eta, G)$.

Proof: An analogous formula for the tangential operator of the signature compex appears in Atiyah et al. [1, II-(2.9)]; the calculations for the tangential
operator of the Dolbeault complex are the same which proves (a); this expresses the eta invariant in terms of trignometric sums. The bundles $\theta(i(M))$ and $(r \otimes 1)(\theta)(M)$ agree which proves (b). To prove (c), we may suppose $M=i(N(J, \tau)) \times M_{1}$ for $J \subseteq G$ and $M_{1} \in M U *$ by Lemma 1.2. We use Lemma 2.1 and ( $\mathrm{a}, \mathrm{b}$ ) to deduce (c) from Frobenius reciprocity; this gives the duality of $(r, i)$ and (ind, $t$ ) with respect to the pairing of the eta invariant. (d) follows from $(b, c)$. Let $\Delta$ correspond to $\tau$. The normal bundle of $\Delta(M)$ in $M$ is given by $\tau$. Define an algebra isomorphism $u$ of $R_{0}(G) \otimes$ $R(U)$ by $u(1 \otimes \operatorname{det})=\operatorname{det}(\tau) \otimes \operatorname{det}, u\left(1 \otimes \Lambda^{i}\right)=\Sigma_{a+b=i} \Lambda^{a}(\tau) \otimes \Lambda^{b}$, $u(\varrho \otimes 1)=\varrho \otimes 1$. Then if $\psi \in R_{0}(G) \otimes R(U)$,

$$
\left.\psi(M)\right|_{\Delta(M)}=u(\psi)(\Delta(M))
$$

We use Lemmas 1.2, 2.1, and 2.2 to see

$$
\eta(u(\theta), \Delta(M))=\eta(\theta \cdot \alpha(\tau), M) \forall \theta \in R_{0}(G) \otimes R(U) \forall M \in M U *(B G)
$$

Since $u$ is an isomorphism, $M \in \operatorname{ker}(\eta, G)$ implies $\Delta(M) \in \operatorname{ker}(\eta, G)$.
We prove Theorem 0.2 one prime at a time. Let $H_{p}$ be a Sylow subgroup of $G$. Since $t: M U *(B G)_{(p)} \mapsto M U *\left(B H_{p}\right)_{(p)}$ is $1-1$ and since $t(\operatorname{ker}(G, \eta)) \subseteq$ $\operatorname{ker}\left(\eta, H_{p}\right)$, it suffices to prove Theorem 0.2 for $G=H_{p}$. Let $\tau$ : $H_{p} \mapsto U(k)$ be fixed point free and irreducible. Suppose inductively $\operatorname{ker}\left(\eta, H_{p}\right) \cap$ $M U_{v}\left(B H_{p}\right)=\{0\}$ for $v<j$. Let $M \in \operatorname{ker}\left(\eta, H_{p}\right) \cap M U_{j}\left(B H_{p}\right)$. Then $\Delta_{\tau}(M) \in \operatorname{ker}\left(\eta, H_{p}\right) \cap M U_{j-2 k}\left(B H_{p}\right)=\{0\}$ so $\Delta(M)=0$. We complete proof of Theorem 0.2 by showing $\operatorname{ker}\left(\eta, H_{p}\right) \cap \operatorname{ker}\left(\Delta_{\tau}\right)=0$. Suppose first $H_{p}$ is cyclic.

Lemma 2.3: Let $M_{1}=N\left(\mathbb{Z}_{n}, \varrho_{1}\right)$ and let $\Delta$ correspond to $\varrho_{1}$.
(a) $\eta\left(\varrho_{0}-\varrho_{1}, M_{1}\right)=n^{-1} . M U_{1}\left(B \mathbb{Z}_{n}\right)=\mathbb{Z}_{n}$ is generated by $M_{1}$.
(b) Let $N \in M U_{2 k}$. If $M_{1} \times N \in \operatorname{ker}\left(\eta, \mathbb{Z}_{n}\right)$, then $N \in n \cdot M U_{2 k}$ and $M_{1} \times$ $N=0$.
(c) $\operatorname{ker}(\Delta) \cap M U_{2 k+1}\left(B \mathbb{Z}_{n}\right)=M_{1} \times M U_{2 k}$ and $\operatorname{ker}(\Delta) \cap \operatorname{ker}\left(\eta, \mathbb{Z}_{n}\right)=0$.

Proof: By Lemmas 1.2 and 2.2, $\eta\left(\varrho_{0}-\varrho_{1}, M_{1}\right)=n^{-1}$ and $\left|M U_{1}\left(B \mathbb{Z}_{n}\right)\right|=n$ which proves (a). Let $\psi \in R(U)$ and decompose $s(\psi)=\Sigma_{i} \psi_{1, i} \otimes \psi_{2, i}$. Since $T\left(M_{1}\right)=1, \psi\left(M_{1} \times N\right)=\psi^{\prime}(N)$ for $\psi^{\prime}=\Sigma_{i} \operatorname{dim}\left(\psi_{1, i}\right)\left(M_{1}\right) \otimes \psi_{2, i}$. If $M_{1} \times N \in \operatorname{ker}\left(\eta, \mathbb{Z}_{n}\right)$, by Lemma 2.1,

$$
0=\eta\left(\left(\varrho_{0}-\varrho_{1}\right) \otimes \psi, M_{1} \times N\right)=n^{-1} \cdot \operatorname{index}\left(\psi^{\prime}, N\right)
$$

The map $\psi \mapsto \psi^{\prime}$ is an algebra isomorphism of $R(U)$, so index $(\psi, N)$ is divisible by $n \forall \psi \in R(U)$. We now come to the essence of the matter. By the Hattori-Stong theorem, $N \in n \cdot M U_{2 k}$ proving (b). Consequently $M_{1} \times$ $M U_{2 k} \cong \mathbb{Z}_{n} \otimes M U_{2 k}$ has $n^{u}$ elements for $u=\operatorname{rank}_{\mathbb{Z}} M U_{2 k}$. Furthermore $M_{1} \times M U_{2 k} \cap \operatorname{ker}\left(\eta, \mathbb{Z}_{n}\right)=\{0\}$ and $M_{1} \times M U_{2 k} \subseteq \operatorname{ker}(\Delta)$. By Lemma 1.3, $\Delta$ is onto so $\operatorname{ker}(\Delta) \cap M U_{2 k+1}\left(B \mathbb{Z}_{n}\right)=\left|M U_{2 k+1}\left(B \mathbb{Z}_{n}\right)\right| /\left|M U_{2 k-1}\left(B \mathbb{Z}_{n}\right)\right|=$ $n^{u}$.

If $H_{p}$ is not cyclic, then $p=2$ and $H_{p}=Q_{m}$. Let $\tau_{0}: Q_{m} \mapsto S U(2)$ be the canonical representation and let $x=\cos \left(2 \pi / 2^{m}\right)+i \cdot \sin \left(2 \pi / 2^{m}\right)$ and $y=j$ generate $Q_{m}$. There are 4 linear representations of $Q_{m}$ defined by:

$$
\begin{array}{llll}
\varrho_{0}(x)=1 & \varrho_{x}(x)=1 & \varrho_{y}(x)=-1 & \varrho_{x y}(x)=-1 \\
\varrho_{0}(y)=1 & \varrho_{x}(y)=-1 & \varrho_{y}(y)=1 & \varrho_{x y}(y)=-1
\end{array}
$$

If $m=2$, we will denote these by $\left\{\varrho_{0}, \varrho_{i}, \varrho_{j}, \varrho_{k}\right\}$ since $x=i, y=j, x y=k$ in that instance. If $z \in Q_{m}$, let $H_{z}$ be the cyclic subgroup generated by $z$. The restriction of $\tau_{0}$ to $H_{x}$ or $H_{y}$ is $\varrho_{1} \oplus \varrho_{3}$. Let

$$
M_{x}=i \cdot N\left(H_{x}, \varrho_{1}\right), M_{y}=i \cdot N\left(H_{y}, \varrho_{1}\right) \quad \text { and } M_{q}=i \cdot N\left(Q_{m}, \tau_{0}\right)
$$

Lemma 2.4: Let $\Delta$ correspond to $\tau_{0}$.
(a) $M U_{1}\left(B Q_{m}\right)=\mathbb{Z}_{2} \oplus \mathbb{Z}_{2}$ with basis $\left\{M_{x}, M_{y}\right\}$.
(b) $M U_{3}\left(B Q_{m}\right)=\mathbb{Z}_{2} \oplus \mathbb{Z}_{2} \oplus \mathbb{Z}_{2^{m+1}}$ with basis $\left\{M_{x} \times C P^{1}, M_{y} \times C P^{1}, M_{q}\right\}$.
(c) If $M \in M U_{3}\left(B Q_{m}\right)$ and $\eta(\varrho, M)=0 \forall \varrho \in R_{0}\left(Q_{m}\right)$, then $M=0$.
(d) If $M=M_{x} \times N_{x}+M_{y} \times N_{y}+M_{q} \times N_{q} \in \operatorname{ker}\left(\eta, Q_{m}\right)$, then $N_{x} \in$ $2 \cdot M U *, N_{y} \in 2 \cdot M U *, N_{q} \in 2^{m} \cdot M U *$, and $M=0$.
(e) $\operatorname{ker}(\Delta) \cap M U_{2 k+1}\left(B Q_{2}\right)=M_{x} \times M U_{2 k} \oplus M_{y} \times M U_{2 k} \oplus M_{q} \times$ $M U_{2 k-2} \cong H_{1}\left(B Q_{2} ; M U_{2 k-2}\right) \oplus H_{3}\left(B Q_{2} ; M U_{2 k-4}\right)$.

Proof: By Lemma 2.2,

$$
\begin{aligned}
& \eta\left(\varrho_{y}-\varrho_{0}, M_{x}\right)=1 / 2 \eta\left(\varrho_{y}-\varrho_{0}, M_{y}\right)=0 \\
& \eta\left(\varrho_{x}-\varrho_{0}, M_{x}\right)=0 \quad \eta\left(\varrho_{x}-\varrho_{0}, M_{y}\right)=1 / 2
\end{aligned}
$$

This gives a map from $M U_{1}\left(B Q_{2}\right) \rightarrow \mathbb{Z}_{2} \oplus \mathbb{Z}_{2} \rightarrow 0$ which proves (a) since $\left|M U_{1}\left(B Q_{2}\right)\right|=4$. Let $\alpha_{0}=2 \varrho_{0}-\tau_{0}$. By Lemmas 2.1 and 2.2,

$$
\begin{array}{lll}
\eta\left(\varrho_{y}-\varrho_{0}, M_{x} \times C P^{1}\right)=1 / 2 & \eta\left(\varrho_{y}-\varrho_{0}, M_{y} \times C P^{1}\right)=0 & \eta\left(\varrho_{y}-\varrho_{0}, M_{q}\right)=* \\
\eta\left(\varrho_{x}-\varrho_{0}, M_{x} \times C P^{1}\right)=0 & \eta\left(\varrho_{x}-\varrho_{0}, M_{y} \times C P^{1}\right)=1 / 2 & \eta\left(\varrho_{y}-\varrho_{0}, M_{q}\right)=* \\
\eta\left(\alpha_{0}, M_{x} \times C P^{1}\right)=0 & \eta\left(\alpha_{0}, M_{y} \times C P^{1}\right)=0 & \eta\left(\alpha_{0}, M_{q}\right)=-1 / 2^{m+1}
\end{array}
$$

which proves ( $\mathrm{b}, \mathrm{c}$ ). The rest of the proof is essentially the same as that of Lemma 2.3 and so is omitted. This completes the proof of Theorem 0.2. The eta invariant is closely related to $K$-theory as well.

Lemma 2.5: Let $\tau$, $\tau^{\prime}$ be fixed point free and let $\varrho \in R_{0}(G)$.
(a) If $\operatorname{deg}(\tau)=\operatorname{deg}\left(\tau^{\prime}\right)$, then $\alpha(\tau) \cdot R(G)=\alpha\left(\tau^{\prime}\right) \cdot R(G)$. If $\operatorname{deg}\left(\tau^{\prime}\right)<$ $\operatorname{deg}(\tau)$, then $\alpha(\tau) \in \alpha\left(\tau^{\prime}\right) \cdot R_{0}(G) . R_{0}(G) / \alpha(\tau) \cdot R(G) \cong \widetilde{K}(N(G, \tau))$.
(b) $\varrho \in \alpha(\tau) \cdot R(G)$ iff $\eta(\varrho \otimes \sigma, N(G, \tau))=0 \forall \sigma \in R_{0}(G)$. $\eta$ is a perfect pairing $\eta: \tilde{K}(N(G, \tau)) \otimes \widetilde{K}(N(G, \tau)) \mapsto \mathbb{Q} / \mathbb{Z}$ exhibiting $\widetilde{K}(N(G, \tau))$ as its Poincare dual. If $\varrho \in \alpha(\tau) \cdot R_{0}(G)$, then $\eta(\varrho, N(G, \tau))=0$.

Proof: See Gilkey [9, Theorem 3.6].

We use Lemma 2.5 to relate define a map from $M U *$ to $K$-theory.

Lemma 2.6: Let $\tau$ be fixed point free of degree $k$ and let $v<2 k-1$.
(a) If $M \in M U_{v}(B G)$ and $\theta \in \alpha(\tau) \cdot R(G) \otimes R(U)$, then $\eta(\theta, M)=0$.
(b) $\exists!g_{\tau}: M U_{v}(B G) \mapsto R_{0}(G) / \alpha(\tau) \cdot R(G)$ so $\eta(\varrho, M)=\eta\left(\varrho \cdot g_{\tau}(M), N(G, \tau)\right)$ $\forall \varrho \in R_{0}(G) . \operatorname{ker}\left(g_{\tau}\right)=\left\{M \in M U_{v}(B G): \eta(\varrho, M)=0 \forall \varrho \in R_{0}(G)\right\}$

Proof: We apply Lemmas 1.2, 2.1, 2.2 and 2.5. Let $\theta=\varrho \otimes \psi \in \alpha(\tau) \cdot R(G) \otimes$ $R(U)$. If $M=N\left(G, \tau^{\prime}\right)$, choose $\sigma \in R(G)$ so $\sigma(M)=\psi(M)$. Since $\varrho \cdot \sigma \in$ $\alpha(\tau) R(G) \subseteq \alpha\left(\tau^{\prime}\right) \cdot R_{0}(G), \eta(\theta, M)=\eta(\varrho \cdot \sigma, M)=0$. If $M=i \cdot N\left(H, \tau^{\prime}\right)$, then $\eta(\theta, M)=\eta\left(r(\theta), N\left(H, \tau^{\prime}\right)\right)=0$ since $r(\theta) \in \alpha(r(\tau)) \cdot R(H) \otimes R(U)$. Since the comultiplication $s$ is $R(G)$ linear, $(1 \otimes s)(\theta) \in \alpha(\tau) \cdot R_{0}(G) \otimes$ $R(U) \otimes R(U)$ so $\eta\left(\theta, i \cdot N\left(H, \tau^{\prime}\right) \cdot N_{1}\right)=0$. Such manifolds generate $M U *(B G)$ which proves (a). Define $f_{M}: R_{0}(G) / \alpha(\tau) \cdot R(G) \mapsto \mathbb{Q} / \mathbb{Z}$ by $f_{M}(\varrho)=$ $\eta(\varrho, M) . \exists!g_{\tau}(M) \in R_{0}(G) / \alpha(\tau) \cdot R(G)$ so $\eta\left(\varrho \cdot g_{\tau}(M), N(G, \tau)\right)=f_{M}(\varrho)$; $g_{\tau}(M)=0 \Leftrightarrow \eta(\varrho, M)=0 \forall \varrho \in R_{0}(G)$.

## 3. $b u *\left(B Q_{2}\right)$ and $b u *(B S L(2,3))$.

In Lemma 1.2, we showed it sufficed to study the Sylow subgroups of $G$. In fact, $M U *, B P *$, and $b u *$ are determined by the maximal cyclic subgroups.

Lemma 3.1: Let $X *=M U *, B P *$, or $b u *$. Let $\left\{C_{v}\right\}$ be the family of maximal cyclic prime order subgroups of $G$. If $M \in M U *(B G)$ and $t_{v}(M)=0 \forall v$, then $M=0$.

Proof: If $X *=b u *$, this follows by [9, Theorem 4.1(a)]. Let $X *=M U *$. By Lemma 1.2 and the transitivity of transfer, we may assume $G=H_{p}$. Lemma 3.1 is trivial if $H_{p}$ is cyclic so let $G=Q_{m}$. Let $H_{z}=\langle z\rangle$ and suppose $t_{z}(M)=0$ for $z=x, y$, or $x y$. By Lemma 2.2, $\eta(\theta, M)=0 \forall \theta \in$ $\operatorname{ind}_{z}\left\{R_{0}\left(H_{z}\right) \otimes R(U)\right\}$. We showed
$\operatorname{span}_{\mathbb{Z}}\left\{\operatorname{ind}_{x}\left\{R_{0}\left(H_{x}\right)\right\}, \operatorname{ind}_{y}\left\{R_{0}\left(H_{y}\right)\right\}, \operatorname{ind}_{x y}\left\{R_{0}\left(H_{x y}\right)\right\}\right\}=R_{0}\left(Q_{m}\right)$
[9, Lemma 4.6] so $\eta(\theta, M) \in \operatorname{ker}(\eta, G)=0$. We use the splitting of $M U *$ in terms of $B P *$ to prove this for $B P *$. Lemma 3.1 is false for $X=\tilde{H}$ and $G=Q_{m}$.

We begin by studying $R_{0}\left(\mathbb{Z}_{4}\right)$ :
Lemma 3.2: Let $u=\alpha\left(\varrho_{1} \oplus \varrho_{3}\right)=2 \varrho_{0}-\varrho_{1}-\varrho_{3}, v=\varrho_{0}-\varrho_{2}$, and $w=$ $\varrho_{0}-\varrho_{1}$.
(a) $u^{2}=4 u-2 v, u \cdot v=2 v$, and $v^{2}=2 v$.
(b) $u^{n+1}=4^{n} \cdot u-2^{n}\left(2^{n}-1\right) \cdot v$.
(c) If $n_{1} \cdot u+n_{2} \cdot v \in R_{0}\left(\mathbb{Z}_{4}\right)^{2 n+2}$, then $n_{1} \equiv 0\left(4^{n}\right)$ and $n_{2} \equiv 0\left(2^{n}\right)$.
(d) If $n_{2} \equiv 0\left(2^{n+1}\right)$, then $n_{2} \cdot v \in R_{0}\left(\mathbb{Z}_{4}\right)^{2 n+2}$.
(e) If $n>0$, then the order of $u$ in $R_{0}\left(\mathbb{Z}_{4}\right) / R_{0}\left(\mathbb{Z}_{4}\right)^{2 n+2}$ is $2^{2 n+1}$.

Proof: (a) is immediate. (b) is true for $n=0$ so we proceed by induction.

$$
\begin{aligned}
u^{n+2} & =u \cdot\left(4^{n} u-2^{n}\left(2^{n}-1\right) v\right)=4^{n+1} \cdot u-2 \cdot 4^{n} \cdot v-2^{n+1}\left(2^{n}-1\right) v \\
& =4^{n+1} \cdot u-2^{n+1}\left(2^{n+1}-1\right) \cdot v .
\end{aligned}
$$

We note $R_{0}\left(\mathbb{Z}_{4}\right)^{2 n+2}=R\left(\mathbb{Z}_{4}\right) \cdot u^{n+1}$. Therefore $R_{0}\left(\mathbb{Z}_{4}\right)^{2 n+2}$ is spanned by

$$
\begin{aligned}
& u^{n+1}=4^{n} \cdot u-2^{n}\left(2^{n}-1\right) \cdot v+0 \cdot w \\
& u^{n+1} \cdot v=0 \cdot u+2^{n+1} v+0 \cdot w \\
& u^{n+1} \cdot w=* \cdot u+{ }^{*} \cdot v+a(n) \cdot w
\end{aligned}
$$

where $a(n) \neq 0$. This proves (c, d). Finally $m \cdot u \in R_{0}\left(\mathbb{Z}_{4}\right)^{2 n+2}$ means

$$
m \cdot u=a_{1}\left(4^{n} u-2^{n}\left(2^{n}-1\right) v\right)+a_{2}\left(2^{n+1}\right) v
$$

or $m=4^{n} a_{1}$ and $a_{1}\left(2^{n}-1\right)=2 a_{2}$ or equivalently $m \equiv 0 \bmod 2^{2 n+1}$.

Let $\left\{\varrho_{0}, \varrho_{i}, \varrho_{j}, \varrho_{k}, \tau_{0}\right\}$ be the representations of $Q_{2}$ and let $\alpha_{0}=\alpha\left(\tau_{0}\right)$. Define an action of $\mathbb{Z}_{3}$ on $Q_{2}$ by the cyclic permuation $i \mapsto j \mapsto k \mapsto i$. Decompose $X *\left(B Q_{2}\right)=X *\left(B Q_{2}\right)^{(0)} \oplus X *\left(B Q_{2}\right)^{(1)}$ under this action. Then

$$
\begin{aligned}
& H_{4 n-5}\left(B Q_{2} ; \mathbb{Z}\right)^{(0)}=H_{4 n-5}(B S L(2,3) ; \mathbb{Z})_{(2)}=\mathbb{Z}_{8} \text { for } n>1 \\
& H_{4 n-3}\left(B Q_{2} ; \mathbb{Z}\right)^{(0)}=H_{4 n-3}(B S L(2,3) ; \mathbb{Z})_{(2)}=0 \quad \text { for } n>0
\end{aligned}
$$

so $X *\left(B Q_{2}\right)^{(0)}=X *(B S L(2,3))_{(2)}$ for $X *=b u *, M U *$, or $B P *$ by Lemma 2.1. Furthermore, $X_{1}(B S L(2,3))_{(2)}=0$. If $n>1$, then

$$
\begin{aligned}
& b u_{4 n-5}(B S L(2,3))_{(2)} \cong b u_{4 n-3}(B S L(2,3))_{(2)} \text { has } 8^{n-1} \text { elements. } \\
& \left|b u_{4 n-5}\left(B Q_{2}\right)^{(1)}\right|=2^{2(n-2)} \text { and }\left|b u_{4 n-3}\left(B Q_{2}\right)^{(1)}\right|=2^{2(n-1)}
\end{aligned}
$$

$R_{0}\left(Q_{2}\right)$ has 4 generators so $b u *\left(B Q_{2}\right)$ has 4 generators. Since no element of $b u *\left(B Q_{2}\right)^{(1)}$ is $\mathbb{Z}_{3}$ invariant, $b u *\left(B Q_{2}\right)^{(1)}$ has at least 2 generators so $b u *\left(B Q_{2}\right)^{(0)}=b u *(B S L(2,3))_{(2)}$ has at most 2 generators. We wish to apply Lemma 3.1 and 3.2. Let $x \in b u_{4 n-5}(B S L(2,3))_{(2)}$. Then $t_{z}(x) \in b u_{4 n-5}\left(B H_{z}\right)=$ $R_{0}\left(\mathbb{Z}_{4}\right)^{2} / R_{0}\left(\mathbb{Z}_{4}\right)^{2 n}$ for $z=i, j, k$. Since u generates $R_{0}\left(\mathbb{Z}_{4}\right)^{2}, 2^{2 n-1} \cdot R_{0}\left(\mathbb{Z}_{4}\right)^{2} \subseteq$ $R_{0}\left(\mathbb{Z}_{4}\right)^{2 n}$ so $2^{2 n-1} \cdot t_{z}(x)=0$ and therefore $2^{2 n-1} \cdot x=0$. As $t_{z}\left(\alpha_{0}\right)=u, \alpha_{0}$ has order $2^{2 n-1}$. Thus there are exactly 2 generators of $b u *(B S L(2,3))_{(2)}$ and

$$
b u_{4 n-5}(B S L(2,3)) \cong b u_{4 n-3}(B S L(2,3)) \cong \mathbb{Z}_{2^{2 n-1}} \oplus \mathbb{Z}_{2^{n-2}}
$$

Consequently $b u *\left(B Q_{2}\right)^{(1)}$ has exactly two generators and admits a free $\mathbb{Z}_{3}$ action. If we can show $b u *\left(B Q_{2}\right)^{(1)}=\mathbb{Z}_{a(v)} \oplus \mathbb{Z}_{a(v)}$, then $a(4 n-5)=2^{n-2}$ and $a(4 n-3)=2^{n-1}$ which will complete the proof of Theorem $0.3(\mathrm{a}, \mathrm{b})$.

Lemma 3.3: Let $A$ be an Abelian 2-group on 2-generators with a fixed point free $\mathbb{Z}_{3}$ action. Then $A=\mathbb{Z}_{a} \oplus \mathbb{Z}_{a}$.

Proof: Let $\lambda \in \mathbb{Z}_{3}$ be the generator and let $A=\mathbb{Z}_{a} \oplus \mathbb{Z}_{b}$ with generators $x, y$ where $b \leqslant a$. Since the action is free, $\left(1+\lambda+\lambda^{2}\right) \cdot x=0$. If $\lambda \cdot x=c x+d y, 0=x+\lambda x+\lambda^{2} x=\left(1+c+c^{2}\right) \cdot x+c d \cdot y+d \cdot \lambda(y)$ so $d(\lambda \cdot y)=\left(-1-c-c^{2}\right) \cdot x+d \cdot y$. As $\left(1+c+c^{2}\right)$ is odd, $b=\operatorname{ord}(y) \geqslant \operatorname{ord}(d \lambda y) \geqslant \operatorname{ord}(x)=a$.

The remainder of this section is devoted to the proof of two technical lemmas we will need in the next section to study $M U *\left(B Q_{2}\right)$ and $M U *(B S L(2,3))_{(2)}$. The reader may wish to skip the proofs until they are needed. Let

$$
\operatorname{ker}\left(\eta, R_{0}(G)\right)=\left\{M \in M U *(B G): \eta(\varrho, M)=0 \forall \varrho \in \mathrm{R}_{0}(G)\right\}
$$

Then $\operatorname{ker}\left(\eta, R_{0}(G)\right)=\operatorname{ker}\left(g_{\tau}\right)$ by Lemma 2.6. Let $\tau: \mathbb{Z}_{4} \mapsto U(n-1)$ and define

$$
M_{1}=N\left(\mathbb{Z}_{4}, \varrho_{1} \oplus \tau\right), M_{2}=N\left(\mathbb{Z}_{4}, \varrho_{3} \oplus \tau\right), M_{3}=i \cdot N\left(\mathbb{Z}_{2}, \varrho_{1} \oplus \tau\right) .
$$

Lemma 3.4: $\operatorname{Span}_{\mathbb{Z}}\left\{M_{i}\right\} \cap \operatorname{ker}\left(\eta, R_{0}\left(\mathbb{Z}_{4}\right)\right)=0$.
Proof: We use Lemmas 2.5 and 2.6. Let $\tau^{\prime}=\varrho_{1} \oplus \varrho_{3} \oplus \tau$ and $N=N\left(\mathbb{Z}_{4}, \tau^{\prime}\right)$. Let $g: M U_{2 n-1}\left(B \mathbb{Z}_{4}\right) \mapsto R_{0}\left(\mathbb{Z}_{4}\right) / R_{0}\left(\mathbb{Z}_{4}\right)^{n+1}$ so $\eta(\varrho, M)=(\varrho \cdot g(M), N) \forall \varrho \in$ $R_{0}\left(\mathbb{Z}_{4}\right)$. Let

$$
\begin{aligned}
& x_{1}=g\left(M_{1}\right)=\left(\varrho_{0}-\varrho_{1}\right), \quad x_{2}=g\left(M_{2}\right)=\left(\varrho_{0}-\varrho_{3}\right), \\
& x_{3}=g\left(M_{3}\right)=\varrho_{0}+\varrho_{2}-\varrho_{1}-\varrho_{3} .
\end{aligned}
$$

Let $M=\Sigma_{i} n_{i} \cdot M_{i} \in \operatorname{ker}\left(\eta, R_{0}\left(\mathbb{Z}_{4}\right)\right)=\operatorname{ker}(g)$. We show $M=0$ by showing $\eta(\theta, M)=0 \forall \theta \in R_{0}\left(\mathbb{Z}_{4}\right) \otimes R(U)$. Let $\theta=\sigma \otimes \psi$. We want to get rid of the dependence on $\psi \in R(U)$ to use Lemma 2.5. We can express $\psi\left(M_{i}\right)$ in terms of the representation theory;

$$
\begin{array}{ll}
\operatorname{det}\left(M_{1}\right)=\left\{\operatorname{det}(\tau) \cdot \varrho_{1}\right\}\left(M_{1}\right) & \Lambda^{i}\left(M_{1}\right)=\Lambda^{i}(\tau) \oplus \varrho_{1} \cdot \Lambda^{i-1}(\tau)\left(M_{1}\right) \\
\operatorname{det}\left(M_{2}\right)=\left\{\operatorname{det}(\tau) \cdot \varrho_{3}\right\}\left(M_{2}\right) & \Lambda^{i}\left(M_{2}\right)=\Lambda^{i}(\tau) \oplus \varrho_{3} \cdot \Lambda^{i-1}(\tau)\left(M_{2}\right) \\
\operatorname{det}\left(M_{1}\right)=\left\{\operatorname{det}(\tau) \cdot \varrho_{1}\right\}\left(M_{3}\right) & \Lambda^{i}\left(M_{3}\right)=\Lambda^{i}(\tau) \oplus \varrho_{1} \cdot \Lambda^{i-1}(\tau)\left(M_{3}\right)
\end{array}
$$

Thus we may assume $\theta\left(M_{1}\right)=\left(\sigma \cdot \varrho_{b}\right)\left(M_{1}\right), \theta\left(M_{2}\right)=\left(\sigma \cdot \varrho_{3 b}\right)\left(M_{2}\right)$, and $\theta\left(M_{3}\right)=\left(\sigma \cdot \varrho_{b}\right)\left(M_{3}\right)$ for $\sigma \in R_{0}\left(\mathbb{Z}_{4}\right)$ and $b \in \mathbb{Z}$. Let

$$
x_{1}(b)=\varrho_{b} \cdot x_{1}, \quad x_{2}(b)=\varrho_{3 b} \cdot x_{2}, \quad x_{3}(b)=\varrho_{b} x_{3} .
$$

If $x(b)=\Sigma_{i} n_{i} \cdot x_{i}(b)$, then $\eta(\theta, M)=\eta(\sigma \cdot x(b), N)$. If $x(b) \in R_{0}\left(\mathbb{Z}_{4}\right)^{n+1}$, $\eta(\theta, M)=0$ which will complete the proof. As $x(b)=\varrho_{b} \cdot g(M)+$ $\varrho_{b} \cdot\left(\varrho_{2 b}-\varrho_{0}\right) \cdot n_{2} \cdot x_{2}$, we must show $\left(\varrho_{2 b}-\varrho_{0}\right) \cdot n_{2} \cdot x_{2} \in R_{0}\left(\mathbb{Z}_{4}\right)^{n+1}$. Let $x=g(M) \in R_{0}\left(\mathbb{Z}_{4}\right)^{n+1}$. We argue as follows. $R_{0}\left(\mathbb{Z}_{4}\right)$ is invariant under the involution $\varrho_{s} \rightarrow \varrho_{s}^{*}=\varrho_{-s}$ so

$$
\begin{aligned}
& x=n_{1}\left(\varrho_{0}-\varrho_{1}\right)+n_{2}\left(\varrho_{0}-\varrho_{3}\right)+n_{3}\left(\varrho_{0}+\varrho_{2}-\varrho_{1}-\varrho_{3}\right) \in R_{0}\left(\mathbb{Z}_{4}\right)^{n+1} \\
& x^{*}=n_{1}\left(\varrho_{0}-\varrho_{3}\right)+n_{2}\left(\varrho_{0}-\varrho_{1}\right)+n_{3}\left(\varrho_{0}+\varrho_{2}-\varrho_{1}-\varrho_{3}\right) \in R_{0}\left(\mathbb{Z}_{4}\right)^{n+1} \\
& \varrho_{1} \cdot x^{*}=n_{1}\left(\varrho_{1}-\varrho_{0}\right)+n_{2}\left(\varrho_{1}-\varrho_{2}\right)+n_{3}\left(\varrho_{1}+\varrho_{3}-\varrho_{0}-\varrho_{2}\right) \in R_{0}\left(\mathbb{Z}_{4}\right)^{n+1} \\
& x+\varrho_{1} \cdot x^{*}=n_{2}\left(\varrho_{0}+\varrho_{1}-\varrho_{2}-\varrho_{3}\right)=n_{2}\left(\varrho_{0}-\varrho_{2}\right)\left(\varrho_{0}-\varrho_{3}\right) \\
& \quad=n_{2}\left(\varrho_{0}-\varrho_{2}\right) x_{2} \in R_{0}\left(\mathbb{Z}_{4}\right)^{n+1} .
\end{aligned}
$$

Next let $\tau=(n-1)\left(\varrho_{1} \oplus \varrho_{3}\right)$ and let

$$
\begin{array}{ll}
M_{1}=N\left(\mathbb{Z}_{4}, \varrho_{1} \oplus \varrho_{3} \oplus \tau\right) & M_{2}=i \cdot N\left(\mathbb{Z}_{2}, \varrho_{1} \oplus \varrho_{1} \oplus \tau\right) \\
M_{3}=N\left(\mathbb{Z}_{4}, \varrho_{1} \oplus \varrho_{1} \oplus \tau\right) & M_{4}=N\left(\mathbb{Z}_{4}, \varrho_{3} \oplus \varrho_{3} \oplus \tau\right) .
\end{array}
$$

Lemma 3.5: $\operatorname{Span}_{\mathbb{Z}}\left\{M_{1}, 2 \cdot M_{2}+M_{3}+M_{4}\right\} \cap \operatorname{ker}\left(\eta, R_{0}\left(\mathbb{Z}_{4}\right)\right)=0$.
Proof: Let $N=N\left(\mathbb{Z}_{4},(n+1) \cdot \tau\right)$. Let $g(M) \in R_{0}\left(\mathbb{Z}_{4}\right) / R_{0}\left(\mathbb{Z}_{4}\right)^{2 n+2}$ so $\eta(\varrho, M)=\eta(\varrho \cdot g(M), N) \forall \varrho \in R_{0}\left(\mathbb{Z}_{4}\right)$. Let $u$ and $v$ be as in Lemma 3.2. If $x_{i}=g\left(M_{i}\right)$, then:

$$
x_{1}=u, \quad x_{2}=\left(\varrho_{0}+\varrho_{2}\right) \cdot u, \quad x_{3}=-\varrho_{1} \cdot u, \quad x_{4}=-\varrho_{3} \cdot u .
$$

Let $M=n_{1} M_{1}+n_{2}\left(2 M_{2}+M_{3}+M_{4}\right) \in \operatorname{ker}\left(\eta, R_{0}\left(\mathbb{Z}_{4}\right)\right)$ so $g(M) \in R_{0}\left(\mathbb{Z}_{4}\right)^{2 n+2}$. Let $\theta=\sigma \otimes \psi \in R_{0}\left(\mathbb{Z}_{4}\right) \otimes R(U)$. We must show $\eta(\theta, M)=0$. As before, we must eliminate the dependence upon $\psi$. We compute:

$$
\begin{aligned}
& \operatorname{det}\left(M_{1}\right)=1 \quad \Lambda^{i}\left(M_{1}\right)=\Lambda^{i-2}(\tau)+\left(\varrho_{1}+\varrho_{3}\right) \cdot \Lambda^{i-1}(\tau)+\Lambda^{i}(\tau) \\
& \operatorname{det}\left(M_{2}\right)=1 \quad \Lambda^{i}\left(M_{2}\right)=\Lambda^{i-2}(\tau)+\left(\varrho_{1}+\varrho_{1}\right) \cdot \Lambda^{i-1}(\tau)+\Lambda^{i}(\tau) \\
& \operatorname{det}\left(M_{3}\right)=\varrho_{2} \quad \Lambda^{i}\left(M_{3}\right)=\varrho_{2} \Lambda^{i-2}(\tau)+\left(\varrho_{1}+\varrho_{1}\right) \cdot \Lambda^{i-1}(\tau)+\Lambda^{i}(\tau) \\
& \operatorname{det}\left(M_{4}\right)=\varrho_{2} \quad \Lambda^{i}\left(M_{4}\right)=\varrho_{2} \Lambda^{i-2}(\tau)+\left(\varrho_{3}+\varrho_{3}\right) \cdot \Lambda^{i-1}(\tau)+\Lambda^{i}(\tau)
\end{aligned}
$$

so we may suppose $\theta\left(M_{i}\right)$ has the form:

$$
\begin{array}{ll}
\theta\left(M_{1}\right)=\sigma \cdot\left(\varrho_{1}+\varrho_{3}\right)^{a} & \theta\left(M_{2}\right)=\sigma \cdot\left(\varrho_{1}+\varrho_{1}\right)^{a} \\
\theta\left(M_{3}\right)=\sigma \cdot \varrho_{2 b} \cdot\left(\varrho_{1}+\varrho_{1}\right)^{a} & \theta\left(M_{4}\right)=\sigma \cdot \varrho_{2 b} \cdot\left(\varrho_{3}+\varrho_{3}\right)^{a} .
\end{array}
$$

for $\sigma \in R_{0}\left(\mathbb{Z}_{4}\right)$ and $a, b \in \mathbb{Z}$. Let

$$
\begin{aligned}
& x_{1}(a, b)=\left(\varrho_{1}+\varrho_{3}\right)^{a} \cdot x_{1}, \quad x_{2}(a, b)=\left(\varrho_{1}+\varrho_{1}\right)^{a} \cdot x_{2}, \\
& x_{3}(a, b)=\varrho_{2 b} \cdot\left(\varrho_{1}+\varrho_{1}\right)^{a} \cdot x_{3} \quad x_{4}(a, b)=\varrho_{2 b} \cdot\left(\varrho_{3}+\varrho_{3}\right)^{a} \cdot x_{4} ; \\
& \eta\left(\theta, M_{i}\right)=\eta\left(\sigma \cdot x_{i}(a, b), N\right) . \text { Let } x(a, b)=n_{1} x_{1}(a, b)+n_{2}\left\{2 \cdot x_{2}(a, b)+\right. \\
& \left.x_{3}(a, b)+x_{4}(a, b)\right\} ; \text { we must show } x(a, b) \in R_{0}\left(\mathbb{Z}_{4}\right)^{2 n+2} .
\end{aligned}
$$

If $a=0, x_{1}(0, b)=x_{1}, x_{2}(0, b)=x_{2},\left\{x_{3}(0, b)+x_{4}(0, b)\right\}=\left\{x_{3}+x_{4}\right\}$ so $x(0, b)=x(0,0)=g(M) \in R_{0}\left(\mathbb{Z}_{4}\right)^{2 n+2}$. If $a>0$, then

$$
\begin{array}{ll}
x_{1}(a, b)=2^{a-1} \cdot \varrho_{a} \cdot\left(\varrho_{0}+\varrho_{2}\right) \cdot x_{1} & x_{2}(a, b)=2^{a} \cdot \varrho_{a} \cdot x_{2} \\
x_{3}(a, b)=2^{a} \cdot \varrho_{a+2 b} \cdot x_{3} & x_{4}(a, b)=2^{a} \cdot \varrho_{3 a+2 b} \cdot x_{4} .
\end{array}
$$

Since $\varrho_{2 b} \cdot\left(\varrho_{0}+\varrho_{2}\right)=\left(\varrho_{0}+\varrho_{2}\right)$ and $\varrho_{2 b} \cdot x_{2}=x_{2}$, we can multiply $x_{i}(a, b)$ by $\varrho_{2 b}$ :

$$
\begin{aligned}
\varrho_{2 b} \cdot x(a, b)= & 2^{a} \cdot \varrho_{a} \cdot g(M)+2^{a-1} n_{1}\left(\varrho_{2}-\varrho_{0}\right) \cdot x_{1} \\
& +2^{a} \cdot n_{2} \cdot\left(\varrho_{2 a}-\varrho_{0}\right) \cdot x_{4} \\
= & 2^{a} \cdot \varrho_{a} \cdot g(M)+2^{a}\left\{n_{1}+\left((-1)^{a}+1\right) n_{2}\right\} v .
\end{aligned}
$$

Since $g(M)=n_{1} \cdot u+n_{2} \cdot\{6 u-6 v\}=\left(n_{1}+6 n_{2}\right) \cdot u-6 n_{2} \cdot v, n_{2} \equiv$ $0\left(2^{n-1}\right)$ and $n_{1} \equiv 0\left(2^{n}\right)$ by Lemma 3.2. Thus $2^{a}\left\{n_{1}+\left((-1)^{a}+1\right) n_{2}\right) \equiv$ $0\left(2^{n+1}\right)$ so $2^{a}\left\{n_{1}+\left((-1)^{a}+1\right) n_{2}\right) v \in R_{0}\left(\mathbb{Z}_{4}\right)^{2 n+2}$.

## 4. $M U *\left(B Q_{2}\right)$ and $M U *(B S L(2,3))$

Let $\alpha_{0}=\alpha\left(\tau_{0}\right)$ and $I=\alpha_{0} \cdot R\left(Q_{2}\right)$. We recall $b u_{4 n-5}\left(B Q_{2}\right)=I / I^{n}$ and $b u_{4 n-3}\left(B Q_{2}\right)=R_{0}\left(Q_{2}\right) / I^{n}$. Let $g_{n}: M U_{v}\left(B Q_{2}\right) \mapsto b u_{4 n-3}\left(B Q_{2}\right)$ for $v \leqslant 4 n-3$ be defined by using Lemma 2.6 so $\eta(\varrho, M)=\eta\left(\varrho \cdot g_{n}(M), N\left(Q_{2}, n \cdot \tau_{0}\right) \forall \varrho \in\right.$ $R_{0}\left(Q_{2}\right)$. If $v=4 n-5$, image $\left(g_{n}\right) \subseteq I$ so

$$
g_{n}: M U_{4 n-5}\left(B Q_{2}\right) \mapsto b u_{4 n-5}\left(B Q_{2}\right) \text { and } g_{n}: M U_{4 n-3}\left(B Q_{2}\right) \mapsto b u_{4 n-3}\left(B Q_{2}\right) .
$$

We will split $g_{n}$ to embed $b u *\left(B Q_{2}\right)$ in $M U *\left(B Q_{2}\right)$ equivariantly with respect to the action of $\mathbb{Z}_{3}$ defined previously. Let $\tau=(n-1) \cdot \tau_{0}, \tau_{1}=(n-1) \cdot$ $\tau_{0} \oplus \varrho_{1}$, and $\tau_{2}=(n-2) \cdot \tau_{0} \oplus 2 \cdot \varrho_{1}$. Let $a=4 n-5$ and $b=4 n-3$. For $a, b>0$ define

$$
\begin{aligned}
& L_{1}(a)=i \cdot N\left(H_{i}, \tau\right)-i \cdot N\left(H_{j}, \tau\right) \\
& L_{2}(a)=i \cdot N\left(H_{j}, \tau\right)-i \cdot N\left(H_{k}, \tau\right) \\
& L_{3}(a)=i \cdot N\left(H_{k}, \tau\right)-i \cdot N\left(H_{i}, \tau\right) \\
& L_{4}(a)=N\left(Q_{2}, \tau\right) \\
& L_{5}(a)=i \cdot N\left(H_{i}, \tau_{2}\right)+i \cdot N\left(H_{j}, \tau_{2}\right)+i \cdot N\left(H_{k}, \tau_{2}\right)
\end{aligned}
$$

$$
\begin{aligned}
& L_{1}(b)=i \cdot N\left(H_{i}, \tau_{1}\right)-i \cdot N\left(H_{j}, \tau_{1}\right) \\
& L_{2}(b)=i \cdot N\left(H_{j}, \tau_{1}\right)-i \cdot N\left(H_{k}, \tau_{1}\right) \\
& L_{3}(b)=i \cdot N\left(H_{k}, \tau_{1}\right)-i \cdot N\left(H_{i}, \tau_{1}\right) \\
& L_{4}(b)=N\left(Q_{2}, \tau\right) \times C P^{1} \\
& L_{5}(b)=L_{5}(4 n-5) \times C P^{1}
\end{aligned}
$$

$L_{5}(1)=0$ as $L_{5}(-1)$ is undefined; $L_{1}+L_{2}+L_{3}=0$. Let $A_{v}=\operatorname{span}_{\mathbb{Z}}$ $\left\{L_{i}(v)\right\} \subseteq M U_{v}\left(B Q_{2}\right) ;\left(A_{v}\right)^{(1)}=\operatorname{span}_{\mathbb{Z}}\left\{L_{1}(v) ; L_{2}(v) ; L_{3}(v)\right\}$, and $\left(A_{v}\right)^{(0)}=$ $\operatorname{span}_{\mathbb{Z}}\left\{L_{4}(v) ; L_{5}(v)\right\}$.

Lemma 4.1: Let $v=4 n-5$ or $v=4 n-3$, then $g_{n}: A_{v} \cong b u_{v}\left(B Q_{2}\right)$ and $g_{n}$ : $A_{v}^{(0)} \cong b u_{v}\left(B Q_{2}\right)^{(0)} \cong b u_{v}(B S L(2,3))_{(2)}$.

Proof: We first show $g$ is $1-1$. If $L \in A_{v}$ and $g(L)=0, L \in \operatorname{ker}(\eta$, $\left.R_{0}\left(Q_{2}\right)\right)$. Decompose $L=L^{(0)}+L^{(1)} ; \eta\left(\varrho, L^{(0)}\right)=0$ if $\varrho \in\left\{R_{0}\left(Q_{2}\right) / I^{n}\right\}^{(1)}$ and $\eta\left(\varrho, L^{(1)}\right)=0$ if $\varrho \in\left\{R_{0}\left(Q_{2}\right) / I^{n}\right\}^{(0)}$ so $L^{(\mu)} \in \operatorname{ker}\left(\eta, R_{0}\left(Q_{2}\right)\right)$ for $\mu=0$, 1 . We show $L^{(\mu)}=0$ by showing $t_{z}\left(L^{(\mu)}\right)=0$. First let $\mu=1$ and let $\tau=(n-1) \cdot \tau_{0}$. For $z=i, j$, or $k$

$$
\begin{aligned}
& t_{z}\left\{L_{i}(4 n-5)\right\}_{i=1,2,3} \in \operatorname{span}_{\mathbb{Z}}\left\{N\left(H_{z}, \tau\right), i \cdot N\left(\mathbb{Z}_{2}, \tau\right)\right\} \\
& t_{z}\left\{L_{i}(4 n-3)\right\}_{i=1,2,3} \in \operatorname{span}_{\mathbb{Z}}\left\{N\left(H_{z}, \tau \oplus \varrho_{1}\right), N\left(H_{z}, \tau \oplus \varrho_{3}\right),\right. \\
& \left.\quad i \cdot N\left(\mathbb{Z}_{2}, \tau \oplus \varrho_{1}\right)\right\}
\end{aligned}
$$

by Lemma 1.1. Since $t_{z}\left(L^{(1)}\right) \in \operatorname{ker}\left(\eta, R_{0}\left(\mathbb{Z}_{4}\right)\right), t_{z}\left(L^{(1)}\right)=0$ by Lemma 3.4 so $L^{(1)}=0$. Next let $\mu=0$ and $v=4 k-5$. Set $\tau_{3}=(n-2) \tau_{0} \oplus 2 \varrho_{1}$, $\tau_{4}=(n-2) \tau_{0} \oplus 2 \varrho_{3}$

$$
\begin{aligned}
& t_{z}\left\{L_{i}(4 n-5)\right\}_{i=4,5} \in \operatorname{span}_{\mathbb{Z}}\left\{N\left(H_{z}, \tau\right), N\left(H_{z}, \tau_{3}\right)+N\left(H_{z}, \tau_{4}\right)\right. \\
& \left.\quad+2 i \cdot N\left(\mathbb{Z}_{2}, \tau\right)\right\}
\end{aligned}
$$

by Lemma 1.1. Since $t_{z}\left(L^{(0)}\right) \in \operatorname{ker}\left(\eta, R_{0}\left(\mathbb{Z}_{4}\right)\right), t_{z}\left(L^{(0)}\right)=0$ by Lemma 3.5. Finally, let $v=4 n-3$. If $L^{(0)}=M \times C P^{1} \in \operatorname{ker}\left(\eta, R_{0}\left(Q_{2}\right)\right)$, then $M \in A_{4 n-5}^{(0)} \cap \operatorname{ker}\left(\eta, R_{0}\left(Q_{2}\right)\right)$ so $M=0$. This shows $g$ is $1-1$.

We show $g$ is onto as follows. Let $x_{i}=g\left(L_{i}(4 n-5)\right)$ and $y_{i}=g\left(L_{i}(4 n-\right.$ 5)). Let $\alpha_{0}=\alpha\left(\tau_{0}\right)=2-\tau_{0}$. Then

$$
\begin{aligned}
& x_{1}=\left\{\operatorname{ind}_{i}(1)-\operatorname{ind}_{j}(1)\right\} \cdot \alpha_{0}=\left(\varrho_{i}-\varrho_{j}\right) \cdot \alpha_{0}, \\
& x_{2}=\left\{\operatorname{ind}_{j}(1)-\operatorname{ind}_{k}(1)\right\} \cdot \alpha_{0}=\left(\varrho_{j}-\varrho_{k}\right) \cdot \alpha_{0}, \\
& x_{3}=\left\{\operatorname{ind}_{k}(1)-\operatorname{ind}_{i}(1)\right\} \cdot \alpha_{0}=\left(\varrho_{k}-\varrho_{i}\right) \cdot \alpha_{0}, \\
& x_{4}=\alpha_{0} \\
& x_{5}=-\left\{\operatorname{ind}_{i}\left(\varrho_{1}\right)+\operatorname{ind}_{j}\left(\varrho_{1}\right)+\operatorname{ind}_{k}\left(\varrho_{1}\right)\right\} \cdot \alpha_{0}=-3 \tau_{0} \cdot \alpha_{0} .
\end{aligned}
$$

Since $\left(1+\varrho_{i}+\varrho_{j}+\varrho_{k}+2 \cdot \tau_{0}\right) \cdot \alpha_{0}=0$ and since $I / I^{n}$ is a 2 -group, the $\left\{x_{i}\right\}$ span $I / I^{n}$ so $g$ is onto in dimension $4 n-5$. Similarly

$$
\begin{aligned}
& y_{1}=\operatorname{ind}_{i}\left(\alpha\left(\varrho_{3}\right)\right)-\operatorname{ind}_{j}\left(\alpha\left(\varrho_{3}\right)\right)=\varrho_{i}-\varrho_{j} \\
& y_{2}=\operatorname{ind}_{j}\left(\alpha\left(\varrho_{3}\right)\right)-\operatorname{ind}_{k}\left(\alpha\left(\varrho_{3}\right)\right)=\varrho_{j}-\varrho_{k} \\
& y_{3}=\operatorname{ind}_{k}\left(\alpha\left(\varrho_{3}\right)\right)-\operatorname{ind}_{i}\left(\alpha\left(\varrho_{3}\right)\right)=\varrho_{k}-\varrho_{i} \\
& y_{4}=x_{4}=\alpha_{0} \\
& y_{5}=x_{5}=3 \tau_{0} \cdot \alpha_{0}=-6 \alpha_{0}+-3\left(\varrho_{i}+\varrho_{j}+\varrho_{k}-3 \varrho_{0}\right)
\end{aligned}
$$

so the $\left\{y_{i}\right\}$ span $R_{0}\left(Q_{2}\right) / I^{n}$; the isomorphism for $\operatorname{BSL}(2,3)$ follows from $\mathbb{Z}_{3}$ equivariance.

Let the generators for $M U=\mathbb{Z}\left[x_{2}, x_{4} \ldots\right]$ be normalized so $a g\left(x_{2 i}\right)=0$ for $i>1$; these are the Hazewinkle generators. Let $P=\mathbb{Z}\left[x_{4}, x_{6}, \ldots\right]$ so $M U=P\left[x_{2}\right]$. Let $S$ be the $P$ submodule of $M U *\left(B Q_{2}\right)$ generated by $A$.

Lemma 4.2:
(a) $\left|A_{4 n-5}\right|=2^{5 n-5}$ and $\left|A_{4 n-3}\right|=2^{5 n-3} . A_{v}=M U_{v}\left(B Q_{2}\right)$ for $v=1,3$.
(b) $M U_{3}\left(B Q_{2}\right) \times\left(x_{2}\right)^{v} \subseteq S_{2 v+3}$.
(c) $S *=M U *\left(B Q_{2}\right)$.
(d) Cartesian product is an isomorphism

$$
A * \otimes P * \cong M U *\left(B Q_{2}\right) \quad \text { and } \quad(A *)^{(0)} \otimes P * \cong M U *(B S L(2,3))
$$

Proof: (a) follows from Lemmas 1.2 and 4.1 (b) is true for $v=0$ by (a) so we proceed by induction. If $M \in M U_{3}\left(B Q_{2}\right)$, we must show $M \times\left(x_{2}\right)^{v} \in$ $S_{2 v+3}$. Set $y=g(M)$ and let $2 v+3=4 n-5$ or $2 v+3=4 n-3$ for $n \geqslant 2$. Choose $M_{1} \in A_{2 v+3}$ so $g\left(M_{1}\right)=y \cdot \alpha_{0}^{n-2}$. Then for all $\varrho \in R_{0}\left(Q_{2}\right)$,

$$
\eta\left(\varrho, M_{1}\right)=\eta\left(\varrho \cdot y \cdot \alpha_{0}^{n-2}, S^{4 n-1} / Q_{2}\right)=\eta\left(\varrho \cdot y, S^{7} / Q_{2}\right)=\eta(\varrho, M)
$$

Since $\Delta\left(L_{\mu}(2 v+3)\right)=L_{\mu}(2 v-1), \Delta\left(M_{1}\right) \in A_{2 v-1}$ and $g\left(\Delta\left(M_{1}\right)\right)=g\left(M_{1}\right)=$ $y \cdot \alpha_{0}^{n-2}=0$ so $\Delta\left(M_{1}\right)=0$. Let $\left\{M_{i}, M_{j}, M_{q}\right\}$ be as in Lemma 2.4. Then

$$
\begin{aligned}
M_{1}= & M_{i} \times\left[a_{i} \cdot x_{2}^{v+1}+B_{i}\right]+M_{j} \times\left[a_{j} \cdot x_{2}^{v+1}+B_{j}\right] \\
& +M_{q} \times\left[a_{q} \cdot x_{2}^{v}+B_{q}\right]
\end{aligned}
$$

where $B_{i}, B_{j}$, and $B_{q}$ are the terms involving elements of positive degree from $P *$ so $a g\left(B_{z}\right)=0$. By induction, $M_{z} \times B_{z} \in S$. If $M_{2}=a_{i} \cdot M_{i} \times x_{2}+$ $a_{j} \cdot M_{j} \times x_{2}+M_{q}$, then $M_{2} \times x_{2}^{v} \in S_{2 v+3}$. Furthermore

$$
\eta(\varrho, M)=\eta\left(\varrho, M_{1}\right)=\eta\left(\varrho, M_{2} \times x_{2}^{v}\right)=\eta\left(\varrho, M_{2}\right)
$$

By Lemma 2.4(c), $M=M_{2}$ which proves (b). Since products of the $M_{z}$ with powers of $x_{2}$ belong to $S$ and since $S$ is a $P$ module, products of the $M_{z}$ with $M U$ belong to $S$. Since $\operatorname{ker}(\Delta)=\Sigma_{z} M_{z} \cdot M U, \operatorname{ker}(\Delta) \subseteq S$. Since $\Delta$ : $S * \rightarrow S *_{-4} \rightarrow 0$, we use the 5 -Lemma and induction to see $S *=M U *\left(B Q_{2}\right)$ which proves (c).

Cartesian product gives an onto map $A * \otimes P * \rightarrow M U *\left(B \mathbb{Z}_{4}\right)$. We show this is an isomorphism by comparing the orders of the groups involved. By Lemma 1.2,

$$
\begin{aligned}
& \left|M U_{2 m-1}\left(B Q_{2}\right)\right|=\left|\oplus_{c \leqslant m} \tilde{H}_{2 c-1}\left(B Q_{2} ; M U_{2 m-2 c}\right)\right| \\
& \quad=\left|\oplus_{c \leqslant m} \tilde{H}_{2 c-1}\left(B Q_{2} ; \oplus_{d \leqslant m-c} P_{2 d}\right)\right|=\left|\oplus_{c+d \leqslant m} \tilde{H}_{2 c-1}\left(B Q_{2} ; P_{2 d}\right)\right| \\
& \quad=\left|\oplus_{c \leqslant a} \tilde{H}_{2 c-1}\left(B Q_{2} ; \oplus P_{2 m-2 a}\right)\right|=\left|\oplus_{a} A_{2 a-1} \otimes P_{2 m-2 a}\right| \\
& \quad=\left|\{A * \otimes P *\}_{2 m-1}\right|
\end{aligned}
$$

The assertion for $\operatorname{BSL}(2,3)$ follows by working $\mathbb{Z}_{3}$ equivariantly. This completes the proof of all the assertions in this paper.
