# GRAPH CONGRUENCES AND PAIR TESTING (*) 

by J. A. Brzozowski ( ${ }^{1}$ ) and Robert Knast ( ${ }^{2}$ )

Communicated by J.-E. PIn

#### Abstract

This paper considers the congruence ${ }_{2} \sim$ on a free monoid where $u_{2} \sim v$ iff $u$ and $v$ have the same letters and the same ordered pairs of letters. The motivation for this comes from the study of bi-locally testable languages defined by testing pairs of words. As in the case of locally testable languages, a theorem on graph congruences is used in order to obtain a characterization of the family of bi-locally testables languages. Such a theorem on graph congruences is developed in this paper.

Résumé. - Dans cet article on considère la congruence sur un monoide libre telle que deux mots soient équivalents si ils contiennent les mêmes lettres et les mêmes couples ordonnés de lettres. L'étude de cette congruence est motivée par l'étude des langages bi-localement testables. Comme dans le cas des langages localement testables, on démontre un théorème sur les congruences de graphe pour caracteriser la classe des langages bi-localement testables.

## 1. INTRODUCTION

The family of locally testable languages plays a key role in the study of star-free languages. It is defined as follows: The membership of a word $w$ in a language $L$ is uniquely determined by the prefix of length $k-1$ of $w$, the suffix of length $k-1$ of $w$, and the set of all segments of length $k$ appearing in $w$, where $k \geqq 1$ is an integer depending on $L$. The syntactic semigroup $S$ that corresponds to a locally testable language $L$ satisfies the condition that for each idempotent $e \in S$, the monoid $e S e$ is idempotent and commutative. Conversely if $S$ is the syntatic semigroup of $L$ and $S$ is finite and satisfies the above-mentioned conditions on $e S e$, then $L$ is locally testable. The proof of this last statement is quite difficult. One of the key steps in this proof is a theorem on graphs. This theorem, due to Simon, appeared originally in [2], though it was not formulated as a separate result on graphs. The treatment

[^0]of the theorem as a theorem on directed graphs is due to Eilenberg [3]. The theorem involves a congruence ${ }_{1} \sim$ that corresponds to $k=1$ in the test described above. More precisely, the prefix and suffix are not tested (since $k-1=0$ ), and only segments of length one (i. e. letters) are considered.

The next family in the hierarchy of languages of depth one [1], after the locally testable family, is that of bi-locally testable languages. Membership of a word $w$ in a bi-locally testable language is determined by the prefix and suffix of length $k-1$ of $w$, and by the set of ordered pairs of segments of length $k$ that appear in $w$. The characterization of syntactic semigroups of bi-locally testable languages is due to Knast [4], and uses the theorem on graphs presented in this paper as one of the basic steps. The theorem involves the congruence ${ }_{2} \sim$ that again corresponds to $k=1$. This time, however, ordered pairs of letters are used.

## 2. THE MAIN THEOREM

We first briefly recall Eilenberg's notation for graphs [3].
A directed graph $G$ consists of two possibly infinite sets $V$ (vertices) and $E$ (edges) along with two functions:

$$
\alpha, \omega: E \rightarrow V .
$$

If $e$ is an edge, $e \alpha$ and $e \omega$ are the initial and final vertices of $e$. Two edges $e_{1}$ and $e_{2}$ are consecutive iff $e_{2} \alpha=e_{1} \omega$. Let $E^{+}\left(E^{*}\right)$ be the free semigroup (free monoid) generated by $E$, and let $C \subseteq E^{2}$ be the set of words $e_{1} e_{2}$ such that $e_{1}$ and $e_{2}$ are non-consecutive. The set of (non-empty) paths of $G$ is then:

$$
P=E^{+}-E^{*} C E^{*}
$$

If $p=e_{1} \ldots e_{n}$ is a path, define $p \alpha=e_{1} \alpha$ and $p \omega=e_{n} \omega$. The length of the path is $|p|=n$, where $n \geqq 1$. A path $p$ is a loop about vertex $v$ iff $v=p \alpha=p \omega$. If $p=e_{1} \ldots e_{n}, q=e_{1}^{\prime} \ldots e_{m}^{\prime}$, and $p \omega=q \alpha$ then $p$ and $q$ are consecutive and $p q=e_{1} \ldots e_{n} e_{1}^{\prime} \ldots e_{m}^{\prime}$ is a path. For any vertex $v, 1_{v}$ is a loop of length 0 about $v$, i. e. $l_{v} \alpha=l_{v} \omega=v$. For technical reasons we assume that the set $\left\{l_{v} \mid v \in V\right\}$ of trivial paths is adjoined to $P$. Two paths $p$ and $p^{\prime}$ are coterminal iff $p \alpha=p^{\prime} \alpha$ and $p \omega=p^{\prime} \omega$. An equivalence relation $\sim$ on $P$ is a congruence iff:
(i) $p \sim p^{\prime}$ implies $p$ and $p^{\prime}$ are coterminal.
(ii) If $p \sim p^{\prime}, q \sim q^{\prime}$ and $p$ and $q$ are consecutive, then $p q \sim p^{\prime} q^{\prime}$.

Let $\tau: E^{*} \rightarrow 2^{E}$ be the function that associates with each word $w$ in $E^{*}$ the set of edges (letters) appearing in $w$ :

$$
w \tau=\left\{e \in E \mid w=w_{1} e w_{2} \quad \text { for some } \quad w_{1}, w_{2} \in E^{*}\right\} .
$$

Similarly let $w \tau_{2}$ be the set of ordered pairs of edges in $w$ :

$$
w \tau_{2}=\left\{\left(e_{1}, e_{2}\right) \in E \times E \mid w=w_{0} e_{1} w_{1} e_{2} w_{2}, w_{0}, w_{1}, w_{2} \in E^{*}\right\} .
$$

We define the following congruence on $E^{*}$. Given $x, y \in E^{*}$ :

$$
x_{2} \sim y \quad \text { iff } \quad x \tau_{2}=y \tau_{2} \quad \text { and } \quad x \tau=y \tau .
$$

If $p$ is a path of length $>0$, then $p \tau$ and $p \tau_{2}$ are defined as above. If $p=1_{v}$ for some $v \in V$ then $p \tau=p \tau_{2}=\varnothing$.

Théorème Let $\sim$ be the smallest congruence on $P$ satisfying:

$$
\begin{equation*}
z_{1}(p q)^{2} p z r(s r)^{2} z_{2} \sim z_{1}(p q)^{2} z^{\prime}(s r)^{2} z_{2} \tag{1}
\end{equation*}
$$

for all $p, q, r, s, z_{1}, z_{2}, z, z^{\prime} \in P$ such that:

$$
z \tau \cong z_{1} \tau \cap z_{2} \tau \quad \text { and } \quad z^{\prime} \tau \cong z_{1} \tau \cap z_{2}
$$

then for any two coterminal paths $x$ and $y$ the conditions $x \sim y$ and $x_{2} \sim y$ are equivalent.

The proof of this result is the subject of the rest of this paper. Before proceeding with the proof we make the following comments. The congruence ${ }_{2} \sim$ involves testing the set $w \tau_{2}$ of pairs of letters appearing in a word $w$ (or the set $w \tau$ in case $w \tau_{2}=\varnothing$, i. e. $|w| \leqq 1$ ), and is defined on $E^{*}$. The theorem states that the equivalence of any two coterminal paths with respect to $2_{2} \sim$ can always be demonstrated by coterminal path transformations of the form (1). It is easily verified that:
$x \sim y \quad$ implies $\quad x_{2} \sim y$.

The converse of (2) constitutes the problem.
Rule (1) is quite complex as compared to the rules in Simon's theorem, where the rules corresponding to (1) are:

$$
x \sim x^{2} \quad \text { and } \quad x y \sim y x,
$$

for any two coterminal loops $x$ and $y$. We were unable to simplify Rule (1) or to replace it by a set of equivalent or weaker rules. The graph of Figure 1 vol. $20, n^{\circ} 2,1986$
provides an example of the difficulty involved. Consider the coterminal paths:

$$
x=c^{\prime} d_{1} c d_{2}\left(a_{1} a_{2}\right)^{2} a_{1} c b_{1}\left(b_{2} b_{1}\right)^{2} e_{1} c e_{2} c^{\prime}
$$

and

$$
y=c^{\prime} d_{1} c d_{2}\left(a_{1} a_{2}\right)^{2} c^{\prime}\left(b_{2} b_{1}\right)^{2} e_{1} c e_{2} c^{\prime}
$$

One easily verifies that $x_{2} \sim y$. If we let $z_{1}=c^{\prime} d_{1} c d_{2}$ and $z_{2}=e_{1} c e_{2} c^{\prime}$, we have an instance where Rule (1) applies. We were unable to find a simpler set of rules for this example.

Figure 1
In a number of cases Rule (1) degenerates to considerably simpler rules. It will be convenient to identify them distinctly, even though they are covered by (1). If $z \tau, z^{\prime} \tau \subset z_{1} \tau \cap z_{2} \tau$ then:

$$
\begin{gather*}
z_{1} z z_{2} \sim z_{1} z^{\prime} z_{2}  \tag{1a}\\
z_{1}(p q)^{2} p z z_{2} \sim z_{1}(p q)^{2} z^{\prime} z_{2},  \tag{1b}\\
z_{1} z r(s r)^{2} z_{2} \sim z_{1} z^{\prime}(s r)^{2} z_{2} . \tag{1c}
\end{gather*}
$$

## 3. SINGULARITIES

Let $A$ be a finite alphabet and $x \in A^{*}$. If $x=x_{1} a x_{2}, a \in A$ and $a \notin\left(x_{1} x_{2}\right) \tau$ then $a$ is a singular letter of $x$. If $x=x_{0} a x_{1} b x_{2}$ where $a$ and $b$ are not singular letters of $x$ and $(b, a) \notin x \tau_{2}$, then $(a, b)$ is a singular pair of $x$. Singular letters and singular pairs are called singularities of $x$. If $x=x_{0} a x_{1} b x_{2}$, this factorization is an occurrence of $(a, b)$. An occurrence is inner if $a \notin x_{1} \tau$, $b \notin x_{1} \tau$. Clearly every singular pair $(a, b)$ has a unique inner occurrence
consisting of the rightmost $a$ of $x$ and the leftmost $b$. An occurrence $x_{0} a x_{1} b x_{2}$ is proper if $a x_{1}$ and $x_{1} b$ have no singularities of $x$; note that every proper occurrence is necessarily inner. A singular pair need not necessarily have a proper occurrence. For example, let $x=a e b b a c d f d f c$. Then $e$ is the only singular letter of $x$ and $(a, c),(a, d),(a, f),(b, c),(b, d),(b, f)$ are the singular pairs of $x$. The factorization (aeb) $b(a c) d(f d f c)$ shows the inner occurrence of $(b, d)$. Only $(a, c)$ has a proper occurrence, namely (aebb) $a(1) c(d f d f c)$.

Proposition 1: Let $(a, b)$ be a singular pair of $x$.
(a) Let $x=x_{0} a x_{1} b x_{2}$ be the inner occurrence. Then:

$$
a \in x_{0} \tau-\left(x_{1} b x_{2}\right) \tau, \quad b \in x_{2} \tau-\left(x_{0} a x_{1}\right) \tau .
$$

(b) Let $x=x_{0} a x_{1} b x_{2}$ be a proper occurrence. Then:

$$
x_{1} \tau \subset x_{0} \tau \cap x_{2} \tau .
$$

(c) Let $x_{2} \sim y$ and let $x=x_{0} a x_{1} b x_{2}$ and $y=y_{0} a y_{1} b y_{2}$ be inner occurrences. Then:

$$
x_{0} \tau=y_{0} \tau, \quad x_{2} \tau=y_{2} \tau .
$$

(d) Let $x_{2} \sim y$ and let $x=x_{0} a x_{1} b x_{2}$ be proper and $y=y_{0} a y_{1} b y_{2}$ be inner. Then $y_{1}$ has no singular letters of $x$.

Proof: (a) If $a \in x_{2} \tau$ then $(b, a) \in x \tau_{2}$ contradicting that $(a, b)$ is singular. If $a \in x_{1} \tau$ then the occurrence shown is not inner. If $a \notin x_{0} \tau$ then $a$ is a singular letter of $x$, contradicting that $(a, b)$ is a singular pair. The same arguments apply to the claim about $b$.
(b) Let $c \in x_{1} \tau$; then ( $\left.a, c\right) \in x \tau_{2}$. The pair ( $a, c$ ) cannot be singular because the occurrence of $(a, b)$ as shown is proper. Hence $(c, a) \in x \tau_{2}$. Since $a \notin\left(x_{1} b x_{2}\right) \tau$, we must have $c \in x_{0} \tau$. Thus $x_{1} \tau \subset x_{0} \tau$, and $x_{1} \tau \subset x_{2} \tau$ follows similarly.
(c) $c \in x_{0} \tau$ implies $(c, a) \in x \tau_{2}=y \tau_{2}$. Hence $c \in y_{0} \tau$, and $x_{0} \tau \subset y_{0} \tau$. Similarly $y_{0} \tau \subset x_{0} \tau$ and the claim follows. By symmetry $x_{2} \tau=y_{2} \tau$.
(d) If $c \in y_{1} \tau$ is singular then ( $\left.c, a\right),(b, c) \notin y \tau_{2}$. Since $x \tau_{2}=y \tau_{2}, c$ must occur exactly once in $x_{1}$, to satisfy these conditions and the condition that $c$ is a singular letter of $x$. But this contradicts the assumption that $x_{0} a x_{1} b x_{2}$ is proper.

Proposition 2: Proper occurrences of singular pairs do not overlap, i. e. suppose $x=x_{0} a x_{1} b x_{2}$ and $x=y_{0} c y_{1} d y_{2}$ where the occurrences are proper;
then either $\left|x_{0}\right| \geqq\left|y_{0} c y_{1} d\right|$ or $\left|y_{0}\right| \geqq\left|x_{0} a x_{1} b\right|$, and $a, b, c, d$ are all distinct.
Proof: Without loss of generality, assume that $\left|x_{0}\right| \leqq\left|y_{0}\right|$. Then $c y_{1} d$ is to the right of $x_{0}$. Suppose first the overlap has the form $b=c$ and $x=x_{0} a x_{1} b y_{1} d y_{2}$. Then $b \notin\left(x_{0} a x_{1}\right) \tau$ because $(a, b)$ is inner as shown and $b \notin\left(y_{1} d y_{2}\right)$ because $(b, d)=(c, d)$ is inner as shown. Hence $b$ is a singular letter, contradicting that $(a, b)$ is a singular pair. Thus this type of overlap cannot occur. Next suppose $x=x_{0} a x_{11} c x_{12} b y_{12} d y_{2}$. We know $a \neq b$ and $c \neq d$. Also $c \neq b$ since $b \notin\left(x_{0} a x_{11} c x_{12}\right) \tau$ because $(a, b)$ is inner. Also $c \notin\left(x_{12} b y_{12} d y_{2}\right) \tau$ because $(c, d)$ is inner. Hence $(c, b)$ is a singular pair of $x$, contradicting that the occurrence of ( $a, b$ ) is proper. Again, this type of overlap cannot occur. Thirdly, if $a=c$, then $x=x_{0} a x_{1} b y_{12} d y_{2}$ and the occurrence of $(a, d)$ cannot de proper. This is a contradiction. Similarly we can't have $b=d$. Finally, we can't have ( $c, d$ ) occur in $x_{1}$ because the occurrence of $(a, b)$ is proper. Hence, no overlap can occur.

We already know that $a \neq b, a \neq c, b \neq c, b \neq d$, and $c \neq d$. One verifies also that $a \neq d$.

## 4. ALIGNMENT OF SINGULARITIES

We introduce the following notation to reduce the number of cases that have to be considered. Let:

## uawbv

represent the usual word $u a w b v$, with $a, b \in A$, or the word $u a v$. The latter case occurs when $w=1$ and $a=b$. Frequently it is possible to handle both cases by the same arguments, and this notation permits this.

Proposition 3: Let $x=x_{0} a x_{1} b x_{2}$ be a proper occurrence of $(a, b)$. Suppose $y_{2} \sim x$ and $y=y_{0} a y_{1} b y_{2}$ where the occurrence of $(a, b)$ is inner. Then either the occurrence of $(a, b)$ in $y$ is proper or $a_{1} b$ contains exactly one proper occurrence of a singular pair of $x$.

Proof: Suppose $(a, b)$ in $y$ is not proper. By Proposition $1(d) y_{1}$ has no singular letters; hence it must have at least one singular pair. Suppose it has two proper occurrences of singular pairs. By Proposition 2 they do not overlap, so $y$ has the form:

$$
y=y_{0} \underline{a y_{10} c y_{11}} d y_{12} e y_{13} \underline{f y_{14} b y_{2}}
$$

where $(c, d)$ and $(e, f)$ are the two proper occurrences. Now $(d, e) \in y \tau_{2}=x \tau_{2}$;
$(b, e) \notin y \tau_{2}$ because $b$ is leftmost and $e$ is rightmost; $(d, a) \notin y \tau_{2}$ because $a$ is rightmost and $d$ is leftmost.

Thus $(e, b)$ and $(a, d)$ are singular pairs of $x$. Therefore $d \notin x_{0} \tau$, and $d \notin x_{1} \tau$ because $x_{0} a x_{1} b x_{2}$ shows a proper pair ( $a, b$ ). Similarly $e \notin x_{2} \tau$ and $e \notin x_{1} \tau$. Hence ( $d, e$ ) cannot occur in $x$. This is a contradiction, showing that exactly one singular pair can be proper in $y_{1}$.

Proposition 4: Let $x=x_{0} a x_{1} b x_{2}$ be a proper occurrence of $(a, b)$ in $x$. Suppose that $x_{2} \sim y$ but $y$ has no proper occurrence of $(a, b)$. By Proposition 3 $y$ has the form $y=y_{0} a y_{10} c y_{11} \underline{d y_{12} b y_{2}}$ where the occurrence of $(a, b)$ is inner, either $a \neq c$ or $b \neq d$, and the occurrence of $(c, d)$ is proper. Then:

$$
x=x_{01} c x_{02} a x_{1} b x_{21} d x_{22}
$$

where the occurrence of $(c, d)$ is inner.
Proof: Observe that $(a, d) \in y \tau_{2}$ but $(d, a) \notin y \tau_{2}$ because $a$ is rightmost and $d$ is leftmost. Hence $(a, d) \in x \tau_{2}$ and $(d, a) \notin x \tau_{2}$. Thus $d \notin x_{0} \tau$. Also $d \notin x_{1} \tau$ because the singular pair ( $a, d$ ) would appear in $a x_{1} b$ and the latter is assumed to be proper. Thus $d \in\left(b x_{2}\right) \tau$ and $x=x_{0} a x_{1} b x_{21} d x_{22}$, where $d \notin x_{21} \tau$. Similarly, $(c, b) \in x \tau_{2},(b, c) \notin x \tau_{2}$ and $x_{0} a=x_{01} c x_{02} a$, giving the desired form for $x$.

Lemma 1: Let $x_{2} \sim y$, where $x$ and $y$ are coterminal paths in a graph. Then there exists $y^{\prime} \sim y$ such that a proper occurrence of a singularity exists in $x$ iff it exists in $y^{\prime}$. Further, if $x=x_{0} a x_{1} b x_{2}$ where $(a, b)$ is proper, then $y^{\prime}=y_{0}^{\prime} a x_{1} b y_{2}^{\prime}$.

Proof: (i) If $x=x_{1} e x_{2}$ where $e$ is a singular letter, we must have $y=y_{1} e y_{2}$, since the occurrence of a singular letter is always proper.
(ii) Suppose $x=x_{0} a x_{1} b x_{2}$ and $y=y_{0} a y_{1} b y_{2}$ where both occurrences are proper. By Proposition $1(b), x_{1} \tau \subset x_{0} \tau \cap x_{2} \tau$ and $x_{0} \tau=y_{0} \tau, x_{2} \tau=y_{2} \tau$ by Proposition 1(c). Thus $x_{1} \tau \subset y_{0} \tau \cap y_{2} \tau$. Also $y_{1} \tau \subset y_{0} \tau \cap y_{2} \tau$. Since $x_{1}$ and $y_{1}$ are coterminal paths, we can apply Rule (1a):

$$
y=\left(y_{0} a\right) y_{1}\left(b y_{2}\right) \sim\left(y_{0} a\right) x_{1}\left(b y_{2}\right)=y^{\prime} .
$$

(iii) Suppose $y$ is as above, but the occurrence of $(a, b)$ is not proper. Then, by Proposition 3:
where $(c, d)$ is proper and $(a, b)$ is inner and either $a \neq c$ or $d \neq b$ or both.

Then, by Proposition 4:

$$
\begin{equation*}
x=x_{01} c x_{02} a x_{1} b x_{21} d x_{22} \tag{4}
\end{equation*}
$$

where $(a, b)$ is proper, $(c, d)$ is inner and either $a \neq c$ or $b \neq d$ or both.
Case 1: $a \neq c, b=d$
We have the following factorizations:

$$
\begin{aligned}
& x=x_{01} c x_{02} a x_{1} b x_{2}, \\
& y=y_{0} a y_{10} c y_{11} b y_{2} .
\end{aligned}
$$

Let $u=y_{10} c y_{11} b y_{2}$, so that $y=y_{0} a u$ where $a$ is rightmost. Then $a \notin u \tau$ and $\left(x_{02} a\right) \tau \not \ddagger u \tau$. However, $\left(x_{02} a\right) \tau \subset y \tau$ because $x_{2} \sim y$ implies $x \tau=y \tau$. Therefore there must exist precisely one suffix $w=\underline{e y_{02} a u}$ of $y$ such that $\left(x_{02} a\right) \tau \subset w \tau$ but $\left(x_{02} a\right) \tau \notin\left(y_{02} a u\right) \tau$, where $y_{02} a$ denotes $y_{02} a$ when $e \neq a$ and $y_{02} a=1$, when $e=a$. Note that $e \notin\left(y_{02} a u\right) \tau$ and also that $e$ must be a letter of $x_{02} a$; let $x_{02} a=x_{02}^{\prime} \underline{e x_{02}^{\prime \prime} a}$, where $e \notin x_{02}^{\prime \prime} \tau$. Then:

$$
\begin{gathered}
x=x_{01} c x_{02}^{\prime} \underline{e x_{02}^{\prime \prime} a x_{1} b x_{2},} \\
y=y_{01} e y_{02} a y_{10} c y_{11} b y_{2}=y_{01} w .
\end{gathered}
$$

Consider the loop $h=e y_{02} a y_{10} c x_{02}^{\prime}$. We claim that this loop can be inserted after $y_{01}$ in $y$ by using Rule (1a). For we have $\left(e y_{02} a y_{10} c\right) \tau \subset w \tau$ by the definition of $w$ above. Also $x_{02}^{\prime} \tau \subset\left(x_{02} a\right) \tau \subset w \tau$. Thus $h \tau \subset w \tau$.

Next we must verify that $h \tau \subset y_{01} \tau$. By construction $e$ is rightmost in $y$. Thus $f \in\left(c x_{02}^{\prime}\right) \tau$ implies $(f, e) \in x \tau_{2}=y \tau_{2}$ and $f \in y_{01} \tau$. Hence $c x_{02}^{\prime} \tau \subset y_{01} \tau$. In fact we have $\left(x_{01}\right) \tau \subset y_{01} \tau$ by the same argument. Now $f \in\left(e y_{02} a y_{10}\right) \tau$ implies $(f, c) \in y \tau_{2}=x \tau_{2}$ and $f \in x_{01} \tau$ because $c$ is rightmost in $x$ as shown. Thus $f \in y_{01} \tau$. Altogether, $h \tau \subset y_{01} \tau$. Inserting two copies of the loop $h$ we have:

$$
\begin{aligned}
& y=y_{01} \underline{e y}_{02} a y_{10} c y_{11} b y_{2} \\
& \sim y_{01}\left(\underline{\left.e y_{02} a y_{10} c x_{02}^{\prime}\right)^{2} \underline{e y_{02} a y_{10}} c y_{11} b y_{2}, ~}\right. \\
& =y_{01} \underline{e y_{02} a}\left(y_{10} c x_{02}^{\prime} \underline{e y_{02} a}\right)^{2} y_{10} c y_{11} b y_{2} .
\end{aligned}
$$

$$
y \sim z_{1}(p q)^{2} p z z_{2} .
$$

We now show that $z \tau \subset z_{1} \tau \cap z_{2} \tau$. In fact, $\mathrm{f} \in \mathrm{y}_{11} \tau$ implies $(c, f) \in y \tau_{2}$ and so ( $f, c$ ) in $y \tau_{2}=x \tau_{2}$ because $(c, b)=(c, d)$ is proper in $y$. Thus $f \in x_{01} \tau \subset y_{01} \tau$, and we have $f \in z_{1} \tau$. Therefore $z \tau \subset z_{1} \tau$. Similarly $f \in y_{11} \tau$ implies $(f, b) \in y \tau_{2}$ and $(b, f) \in y \tau_{2}$. Hence $f \in y_{2} \tau$ and $z \tau \subset z_{2} \tau$.

Let $z^{\prime}=x_{1}$. Then $x_{1} \tau \subset z_{1} \tau \cap z_{2} \tau$ by similar arguments. We are now in a position to apply Rule ( 1 b ):

$$
\begin{aligned}
y & \sim z_{1}(p q)^{2} p z z_{2} \\
& \sim z_{1}(p q)^{2} z^{\prime} z_{2} \\
& \left.=y_{01} \underline{e y_{02} a} a y_{10} c x_{02}^{\prime} \underline{e y_{02} a}\right)^{2} x_{1} b y_{2} \\
& =\left[y_{01}\left(e y_{02} a y_{10} c x_{02}^{\prime}\right)^{2} e y_{02}\right] a x_{1} b y_{2} \\
& =y_{1}^{\prime} a x_{1} b y_{2}^{\prime}=y^{\prime},
\end{aligned}
$$

which has the desired form. We can also write:

$$
y^{\prime}=y_{01} e y_{02} g^{2} a x_{1} b y_{2}=y_{0} g^{2} a x_{1} b y_{2},
$$

where $g=a y_{10} c x_{02}^{\prime} e y_{02}$. Recal that proper singularities do not overlap. In $y=y_{0} a y_{10} c y_{11} b y_{2}$ we have the proper singularities in $y_{0} a y_{10}$ and in $y_{2}$ and the pair ( $c, b$ ). By Proposition 3 the segment $a y_{10} c y_{11} b$ has only one proper singularity; hence there are none in $a y_{10}$. Now in $y^{\prime}$ we have the proper singularities of $y_{0} a y_{10}$ and $y_{2}$ and the pair ( $a, b$ ) which replaced ( $c, b$ ). The segment $g^{2}$ is free of singularities, since each pair $\left(f, f^{\prime}\right) \in g \tau \times g \tau$ appears at least twice in $g^{2}$ if $f \neq f^{\prime}$, and $g^{2}$ can't have any singular letters. This leaves the possibility that there is a proper singularity in $y_{0} g$ of the type $f \in y_{0} \tau$, $f^{\prime} \in g \tau$. But $g \tau \subset y_{01} \tau \subset y_{0} \tau$. Hence either $\left(f^{\prime}, f\right) \in y_{0} \tau_{2}$ and ( $f, f^{\prime}$ ) is not singular, or $\left(f, f^{\prime}\right) \in y_{0} \tau_{2}$ and the singularity in $y_{0} g$ was not proper. Thus $y^{\prime}$ has only the proper singularities of $y$ with $(c, d)$ replaced by $(a, b)$.

Case 2: $a=c, b \neq d$
This follows by left-right symmetry from Case 1. This time a loop is inserted on the right side and Rule (1c) is applied.

Case 3: $a \neq c, b \neq d$
Proceed as in Case 1 inserting first the left loop, then the right loop, and apply Rule (1).

In all cases of (iii) we can transform $y$ into $y^{\prime}$ in such a way that the proper singularities of $y^{\prime}$ are the same as those of $y$ except that $(c, d)$ has been replaced by ( $a, b$ ). Now consider two words $x, y \in A^{*}$ such that $x_{2} \sim y$.
each singular letter of $x$ must also be a singular letter of $y$ and vice versa. Also, if $(a, b)$ has a proper occurrence in $x$ then either $(a, b)$ is also proper in $y$, or ( $a, b$ ) occurs in $y$ with another proper pair $(c, d)$, as in Propositions 3 and 4. As shown above, we can find $y^{\prime}$ such that $y^{\prime} \sim y$ and the singularities of $y^{\prime}$ are those of $y$, with the exception that $(c, d)$ has been replaced by $(a, b)$. By repeating this process we find $y^{\prime} \sim y$ such that $y^{\prime}$ has exactly the same singularities as $x$. It is easily verified that these singularities must appear in $y^{\prime}$ in the same order as in $x$. Thus we may assume at this point that $x$ and $y$ have the same singularities and that they have the form:

$$
\begin{aligned}
& x=x_{0} s_{1} x_{1} s_{2} \ldots s_{m} x_{m}, \\
& y=y_{0} s_{1} y_{1} s_{2} \ldots s_{m} y_{m},
\end{aligned}
$$

where $m \geqq 0, x_{i}, i=0, \ldots, m$, do not have any singularities of $x$ and either $s_{i}=e, e \in A$, or $s_{i}=a w_{i} b$ is a proper singular pair of $x$.

## 5. SEGMENTS BETWEEN SINGULARITIES

Refer to the factorizations of $x$ and $y$ above that show all the proper singularities. In this section we will show that the segments $y_{i}$ between proper singularities can be replaced by the segments $x_{i}$ by using only Rule (1). The main result here is Lemma 2, but we need several preliminary results first.

Proposition 5: Let:

$$
x=\bar{x}_{1} \bar{x}_{2} \bar{x}_{3}=\left(x_{0} s_{1} \ldots x_{i} s_{i}\right) x_{i+1}\left(s_{i+1} x_{i+2} \ldots s_{m} x_{m}\right),
$$

$i \geqq 0, m \geqq 0$, where $\bar{x}_{1}=x_{0} s_{1} \ldots x_{i} s_{i}, \bar{x}_{2}=x_{i+1}$, and $\bar{x}_{3}=\left(s_{i+1} x_{i+2} \ldots s_{m} x_{m}\right)$, and let:

$$
y=\bar{y}_{1} \bar{y}_{2} \bar{y}_{3}=\left(y_{0} s_{1} \ldots y_{i} s_{i}\right) y_{i+1}\left(s_{i+1} y_{i+2} \ldots s_{m} y_{m}\right)
$$

be similarly defined, where $x_{2} \sim y, x$ and $y$ are coterminal, and $x$ and $y$ have the same proper singularities. Then $\bar{x}_{2}$ and $\bar{y}_{2}$ are coterminal and

$$
\begin{aligned}
\bar{x}_{1} \tau=\bar{y}_{1} \tau, \quad \bar{x}_{3} \tau=\bar{y}_{3} \tau \\
\left(\bar{x}_{1} \bar{x}_{2}\right) \tau=\left(\bar{y}_{1} \bar{y}_{2}\right) \tau, \quad\left(\bar{x}_{2} \bar{x}_{3}\right) \tau=\left(\bar{y}_{2} \bar{y}_{3}\right) \tau
\end{aligned}
$$

Proof: If $x$ has no proper singularities then $\bar{x}_{2}=x$ and $\bar{y}_{2}=y$ and the claims easily follow. If $x$ has exactly one singularity then either $\bar{x}_{1}=1, \bar{x}_{2}=x_{0}$, $\bar{x}_{3}=\mathrm{s}_{1} x_{1}$ or $\bar{x}_{1}=x_{0} s_{1}, \bar{x}_{2}=x_{1}$, and $\bar{x}_{3}=1$. In the first case $\bar{y}_{1}=1, \bar{y}_{2}=y_{0}$ and $\bar{y}_{3}=s_{1} y_{1}$. Again the claim is easily verified here, and the second case is symmetric. The general case follows easily with the aid of Proposition 1 (c).

Informatique théorique et Applications/Theoretical Informatics and Applications

Proposition 6: Let $x \in A^{*}$ have the factorization:

$$
x=x_{1} x_{2} x_{3}=x_{1} x_{21} a x_{22} x_{3},
$$

where $x_{2}=x_{21} a x_{22}, a \in A$, and $a \notin\left(x_{1} x_{21}\right) \tau$. If $x_{2}$ has no singularities of $x$, then:

$$
\left(x_{21} a\right) \tau \subset\left(x_{22} x_{3}\right) \tau
$$

Proof: Since $a$ appears in $x_{2}$ and $x_{2}$ has no singularities of $x$, we have $(a, a) \in x \tau_{2}$. Because $a \notin\left(x_{1} x_{21}\right) \tau$, we must have $a \in\left(x_{22} x_{3}\right) \tau$. Also $e \in x_{21} \tau$ implies $(e, a) \in x_{2} \tau_{2}$. Since $x_{2}$ has no singularities of $x$, we have $(a, e) \in x \tau_{2}$ and $e \in\left(x_{22} x_{3}\right) \tau$. Thus $\left(x_{21} a\right) \tau \subset\left(x_{22} x_{3}\right) \tau$.

Proposition 7: Let $x, y \in A^{*}$ have the factorizations:

$$
\begin{gathered}
x=x_{1} x_{2} x_{3}=x_{1} x_{21} a x_{22} x_{3}, \\
y=y_{1} y_{2} y_{3}=y_{1} y_{21} a y_{22} y_{3}
\end{gathered}
$$

where $x_{2}$ and $y_{2}$ have no singularities of $x$, and $x_{2}=x_{21} a x_{22}, y_{2}=y_{21} a y_{22}$, $a \in A, \quad a \notin\left(x_{1} x_{21}\right) \tau \cup\left(y_{1} y_{21}\right) \tau$. Then $\quad\left(x_{2} x_{3}\right) \tau=\left(y_{2} y_{3}\right) \tau \quad$ implies $\left(x_{22} x_{3}\right) \tau=\left(y_{22} y_{3}\right) \tau$.

Proof: $\left(x_{22} x_{3}\right) \tau=\left(x_{21} a x_{22} x_{3}\right) \tau=\left(x_{2} x_{3}\right) \tau$ by Proposition 6. Similarly $\left(y_{22} y_{3}\right) \tau=\left(y_{2} y_{3}\right) \tau$ and the claim follows.

Let $x, y \in A^{*}$ be such that $x \tau=y \tau$ and let $B$ be a given subset of $x \tau$. Let $\bar{x}$ and $\bar{y}$ be prefixes of $x$ and $y$ respectively. The pair $(\bar{x}, \bar{y})$ is called a $B$-pair iff:

$$
\bar{x} \tau=\bar{y} \tau \supset B .
$$

Let $P_{B}(x, y)$ be the set of all $B$-pairs of $x$ and $y$. This set is nonempty since $(x, y) \in P_{B}(x, y)$. Define the binary relation $\leqq$ on $P_{B}(x, y)$ by:

$$
\left(x_{1}, y_{1}\right) \leqq\left(x_{2}, y_{2}\right) \quad \text { iff } \quad\left|x_{1}\right| \leqq\left|x_{2}\right| \quad \text { and } \quad\left|y_{1}\right| \leqq\left|y_{2}\right|
$$

One verifies that $\leqq$ is a partial order on $P_{B}(x, y)$.
Proposition 8: $P_{B}(x, y)$ has a unique minimal element with respect to $\leqq$.
Proof: Because $P$ is finite it suffices to show that for all $p_{1}=\left(x_{1}, y_{1}\right)$, $p_{2}=\left(x_{2}, y_{2}\right)$ in $P_{B}(x, y)$ there exists $\bar{p}=(\bar{x}, \bar{y}) \in P_{B}(x, y)$ such that $\bar{p} \leqq p_{1}$ and $\bar{p} \leqq p_{2}$. If $p_{1} \leqq p_{2}$, let $\bar{p}=p_{1}$. If $p_{2} \leqq p_{1}$, let $\bar{p}=p_{2}$. Now suppose neither $p_{1} \leqq p_{2}$ nor $p_{2} \leqq p_{1}$. Suppose also that $\left|x_{1}\right|>\left|x_{2}\right|$. Then, since $p_{1} \nsupseteq p_{2}$, we must have $\left|y_{1}\right|<\left|y_{2}\right|$. Now:

$$
x_{2} \tau \subset x_{1} \tau=y_{1} \tau \subset y_{2} \tau=x_{2} \tau .
$$

Let $\bar{p}=\left(x_{2}, y_{1}\right)$. Then $\bar{p}$ is a $B$-pair and $\bar{p} \leqq p_{1}, \bar{p} \leqq p_{2}$. Similarly, if $\left|x_{1}\right|<\left|x_{2}\right|$, then $\left|y_{1}\right|>\left|y_{2}\right|$. Let $\bar{p}=\left(x_{1}, y_{2}\right)$; then $\bar{p}$ is the required $B$-pair. Finally the case $\left|x_{1}\right|=\left|x_{2}\right|$ cannot occur, for then either $p_{1} \leqq p_{2}$ or $p_{2} \leqq p_{1}$.

Lemma 2: Let $x$ and $y$ be coterminal paths such that $x_{2} \sim y$ and suppose that $x$ and $y$ have the factorizations:

$$
x=x_{1} x_{2} x_{3}, \quad y=y_{1} y_{2} y_{3}
$$

where $x_{2}$ and $y_{2}$ are coterminal and do not contain any singularities of $x$ and:

$$
\begin{aligned}
x_{1} \tau=y_{1} \tau, & x_{3} \tau=y_{3} \tau, \\
\left(x_{1} x_{2}\right) \tau=\left(y_{1} y_{2}\right) \tau, & \left(x_{2} x_{3}\right) \tau=\left(y_{2} y_{3}\right) \tau .
\end{aligned}
$$

Then $y \sim y_{1} x_{2} y_{3}$.
Proof: The proof proceeds by induction on $\left|x_{2}\right|+\left|y_{2}\right|$.
Basis: $\left|x_{2}\right|+\left|y_{2}\right|=0$
Here $x_{2}=y_{2}=1$ and $y=y_{1} 1 y_{3} \sim y_{1} x_{2} y_{3}$.
Induction Step: $\left|x_{2}\right|+\left|y_{2}\right|>0$
We assume that the lemma holds for all cases where $\left|x_{2}\right|+\left|y_{2}\right| \leqq k$. Suppose now that $\left|x_{2}\right|+\left|y_{2}\right|=k+1$. The proof will be decomposed into several cases.

Case 1: $x_{2} \tau \subset x_{1} \tau$ and $x_{2} \tau \subset x_{3} \tau$
Here $y_{2} \tau \subset\left(y_{1} y_{2}\right) \tau=\left(x_{1} x_{2}\right) \tau=x_{1} \tau=y_{1} \tau$. Similarly $y_{2} \tau \subset y_{3} \tau$. Also $x_{2} \tau \subset y_{1} \tau \cap y_{3} \tau$. By Rule (1a):

$$
y=y_{1} y_{2} y_{3} \sim y_{1} x_{2} y_{3} .
$$

Case 2: $x_{2} \tau \nleftarrow x_{1} \tau$
Note that $y_{2} \tau \not \& y_{1} \tau$; otherwise:

$$
x_{2} \tau \subset\left(x_{1} x_{2}\right) \tau=\left(y_{1} y_{2}\right) \tau=y_{1} \tau=x_{1} \tau
$$

which is a contradiction. Let $a$ be the first letter of $x_{2}$ from the left that does not appear in $x_{1}$. Similarly let $b$ be the first letter of $y_{2}$ from the left that is not in $y_{1}$. Then $x_{2}=x_{21} a x_{22}, y_{2}=y_{21} b y_{22}$ and

$$
\begin{array}{lll}
x=x_{1} x_{21} a x_{22} x_{3}, & \text { where } & a \notin\left(x_{1} x_{21}\right) \tau=x_{1} \tau \\
y=y_{1} y_{21} b y_{22} y_{3}, & \text { where } & b \notin\left(y_{1} y_{21}\right) \tau=y_{1} \tau . \tag{6}
\end{array}
$$

We consider next two subcases.

Case 2.1: $a=b$
Here we have:

$$
\begin{equation*}
y=y_{1} y_{21} a y_{22} y_{3}, \quad \text { where } \quad a \notin\left(y_{1} y_{21}\right) \tau=y_{1} \tau \tag{7}
\end{equation*}
$$

and $x$ is as in (5). Now $x_{21}$ and $y_{21}$ are coterminal and $x_{21} \tau, y_{21} \tau \subset y_{1} \tau$. By Proposition 6, $\quad y_{21} \tau \subset\left(y_{22} y_{3}\right) \tau$. By Propositions 6 and 7, $x_{21} \tau \subset\left(x_{22} x_{3}\right) \tau=\left(y_{22} y_{3}\right) \tau$. By Rule (1a):

$$
\begin{equation*}
y=\left(y_{1}\right)\left(y_{21}\right)\left(a y_{22} y_{3}\right) \sim\left(y_{1}\right)\left(x_{21}\right)\left(a y_{22} y_{3}\right)=y^{\prime} \tag{8}
\end{equation*}
$$

Now let $x_{1}^{\prime}=x_{1} x_{21} a, x_{2}^{\prime}=x_{22}$, and $x_{3}^{\prime}=x_{3}$. Then:

$$
\begin{equation*}
x=x_{1}^{\prime} x_{2}^{\prime} x_{3}^{\prime}=\left(x_{1} x_{21} a\right)\left(x_{22}\right)\left(x_{3}\right) \tag{9}
\end{equation*}
$$

Similarly, let $y_{1}^{\prime}=y_{1} x_{21} a, y_{2}^{\prime}=y_{22}$, and $y_{3}^{\prime}=y_{3}$. Then:

$$
\begin{equation*}
y=y_{1}^{\prime} y_{2}^{\prime} y_{3}^{\prime}=\left(y_{1} x_{21} a\right)\left(y_{22}\right)\left(y_{3}\right) \tag{10}
\end{equation*}
$$

We verify the 4 conditions of the lemma:
(i) $x_{1}^{\prime} \tau=\left(x_{1} x_{21} a\right) \tau=\left(y_{1} x_{21} a\right) \tau=y_{1}^{\prime} \tau$.
(ii) $\left(x_{1}^{\prime} x_{2}^{\prime}\right) \tau=\left(x_{1} x_{2}\right) \tau=\left(y_{1} y_{2}\right) \tau=\left(y_{1}^{\prime} y_{2}^{\prime}\right) \tau$.
(iii) $x_{3}^{\prime} \tau=x_{3} \tau=y_{3} \tau=y_{3}^{\prime} \tau$.
(iv) $\left(x_{2}^{\prime} x_{3}^{\prime}\right) \tau=\left(x_{22} x_{3}\right) \tau=\left(y_{22} y_{3}\right) \tau=\left(y_{2}^{\prime} y_{3}^{\prime}\right) \tau$ by Proposition 7 .

Note that $x_{2}^{\prime}$ is a proper factor of $x_{2}$ and $y_{2}^{\prime}$ is a proper factor of $y_{2}$. Hence $x_{2}^{\prime}$ and $y_{2}^{\prime}$ do not contain any singularities of $x$. Evidently $\left|x_{2}^{\prime}\right|+\left|y_{2}^{\prime}\right|<\left|x_{2}\right|+\left|y_{2}\right|$ and we can apply the induction hypothesis:

$$
y^{\prime}=y_{1}^{\prime} y_{2}^{\prime} y_{3}^{\prime} \sim y_{1}^{\prime} x_{2}^{\prime} y_{3}^{\prime}=y_{1} x_{21} a x_{22} y_{3}=y_{1} x_{2} y_{3}
$$

Altogether $y \sim y^{\prime} \sim y_{1} x_{2} y_{3}$ and the induction step goes through in this case.
Case 2. 2: $a \neq b$
Refer to (5) and (6). Since $b \in\left(y_{1} y_{2}\right) \tau-y_{1} \tau=\left(x_{1} x_{2}\right) \tau-x_{1} \tau$ we must have $b \in x_{22} \tau$. Similarly $a \in y_{22} \tau$ and:

$$
\begin{equation*}
x=x_{1} x_{2} x_{3}=x_{1}\left(x_{21} a x_{22}\right) x_{3}=x_{1} x_{21} a\left(s_{1} b s_{2}\right) x_{3} \tag{11}
\end{equation*}
$$

where $x_{22}=s_{1} b s_{2}$ and $b \notin\left(x_{1} x_{21} a s_{1}\right) \tau$, and

$$
\begin{equation*}
y=y_{1} y_{2} y_{3}=y_{1}\left(y_{21} b y_{22}\right) y_{3}=y_{1} y_{21} b\left(t_{1} a t_{2}\right) y_{3}, \tag{12}
\end{equation*}
$$

where $y_{22}=t_{1} a t_{2}$ and $a \notin\left(y_{1} y_{21} b t_{1}\right) \tau$. In other words the leftmost appearances of $b$ in $x$ and $a$ in $y$ are shown.

Let $\left(a s_{1}\right) \tau \cup\left(b t_{1}\right) \tau=B$. The prefixes $x_{1} x_{2}$ of $x_{1} x_{2}$ and $y_{1} y_{2}$ of $y_{1} y_{2}$ satisfy:

$$
\left(x_{1} x_{2}\right) \tau=\left(y_{1} y_{2}\right) \tau \supset B .
$$

Thus $\left(x_{1} x_{2}, y_{1} y_{2}\right)$ is a $B$-pair. By Proposition 8, there exists a minimal $B$-pair $(\bar{x}, \bar{y})$. Since $b \in B$ and $b \notin\left(x_{1} x_{21} a s_{1}\right) \tau$ we have:

$$
\begin{equation*}
\left|x_{1} x_{2} a s_{1} b\right| \leqq|\bar{x}| \leqq\left|x_{1} x_{2}\right| \tag{13}
\end{equation*}
$$

Similarly

$$
\begin{equation*}
\left|y_{1} y_{21} b t_{1} a\right| \leqq|\bar{y}| \leqq\left|y_{1} y_{2}\right| . \tag{14}
\end{equation*}
$$

Let $c$ be the last letter of $\bar{x}$ and $d$ the last letter of $\bar{y}$, and let $\bar{x}=p c$ and $\bar{y}=q d$. We claim first that $c \neq d$. Note that $c \notin p \tau$, for otherwise the pair $(p, \bar{y})$ would be a shorter $B$-pair. Similarly $d \notin q \tau$. Assume now that $c=d$. If $c \notin B$, then $(p, q)$ is a $B$-pair, contradicting the assumption that ( $p c, q c$ ) is minimal. Thus $c \in B=\left(a s_{1} b t_{1}\right) \tau$. Since $\left|x_{1} x_{21} a s_{1} b\right| \leqq|p c|$ and $c \notin p \tau$, the condition $c \notin\left(a s_{1} b\right) \tau$ implies $c=b$. But then $c \in\left(y_{1} y_{21} b t_{1}\right) \tau$ and $y_{1} y_{21} b t_{1}$ is a proper prefix of $\bar{y}$. This implies $c \in q \tau$ which is a contradiction. Hence we cannot have $c \in\left(a s_{1} b\right) \tau$ and we must have $c \in t_{1} \tau$. This is again a contradiction of the fact that $c \notin q \tau$. Therefore $c \neq d$.

From (13) and (11) it is clear that either $c=b$ or $c \neq b$ and $c \in s_{2}$. Both cases can be handled by the notation:

$$
\begin{equation*}
p c=x_{1} x_{21} a s_{1} b s_{21} . \tag{15}
\end{equation*}
$$

For if $c=b$, let $s_{21}=1$. Otherwise let $s_{21}$ be the shortest prefix of $s_{2}$ that ends in $c$. In either case let $s_{2}=s_{21} s_{22}$. Similarly:

$$
\begin{equation*}
q d=y_{1} y_{21} b t_{1} a t_{21} \tag{16}
\end{equation*}
$$

where $t_{2}=t_{21} t_{22}$ and $t_{21}=1$ if $d=a$, and $t_{21}$ is the shortest prefix of $t_{2}$ that ends in $d$, otherwise. Now let:

$$
\begin{aligned}
& f=a s_{1} b s_{21} \\
& g=b t_{1} a t_{21}
\end{aligned}
$$

We now arrive at the decompositions of $x$ and $y$ :

$$
\begin{align*}
& x=x_{1} x_{2} x_{3}=x_{1} x_{21} a x_{22} x_{3}=x_{1} x_{21} a s_{1} b s_{2} x_{3} \\
& =x_{1} x_{21} a s_{1} b s_{21} s_{22} x_{3}=x_{1} x_{21} f s_{22} x_{3}=p c s_{22} x_{3}  \tag{17}\\
& \begin{aligned}
y=y_{1} y_{2} y_{3}=y_{1} y_{21} b y_{22} & y_{3}=y_{1} y_{21} b t_{1} a t_{2} y_{3} \\
& =y_{1} y_{21} b t_{1} a t_{21} t_{22} y_{3}=y_{1} y_{21} g t_{22} y_{3}=q d t_{22} y_{3} .
\end{aligned}
\end{align*}
$$

Consider next where $c$ can appear in $y$. Since $c \in(p c) \tau=(q d) \tau$, we must have $c \in\left(y_{1} y_{21} b t_{1} a t_{21}\right) \tau$. If $c \in\left(y_{1} y_{21}\right) \tau$ then $c \in x_{1} \tau$ and $c \in p \tau$ which is a contradiction. Hence $c \in\left(b t_{1} a t_{21}\right) \tau=g \tau$. Similarly $d \in\left(a s_{1} b s_{21}\right) \tau=f \tau$. Let:

$$
\begin{array}{lll}
f=a s_{1} b s_{21}=u_{1} d u_{2} c, & \text { where } & d \notin u_{2} \tau, \\
g=b t_{1} a t_{21}=v_{1} c v_{2} d, & \text { where } & c \notin v_{2} \tau . \tag{20}
\end{array}
$$

In other words we take the rightmost appearances of $d$ in $f$ and $c$ in $g$. We now have the factorizations illustrated in Figure 2. Of necessity, the figure shows a particular case and should only be used as a visual aid.

We will deal with the factorization:

$$
\begin{equation*}
x=x_{1}^{\prime} x_{2}^{\prime} x_{3}^{\prime}=\left(x_{1} x_{21} f\right)\left(s_{22}\right)\left(x_{3}\right), \tag{21}
\end{equation*}
$$

where $x_{1}^{\prime}=x_{1} x_{21} f, x_{2}^{\prime}=s_{22}, x_{3}^{\prime}=x_{3}$. We begin with:

$$
y=y_{1} y_{21} g t_{22} y_{3}
$$

and we will show that $y \sim y^{\prime}$ where:

$$
\begin{equation*}
y^{\prime}=y_{1}^{\prime} y_{2}^{\prime} y_{3}^{\prime}=\left(y_{1} x_{21} f\right)\left(v_{2} d t_{22}\right)\left(y_{3}\right), \tag{22}
\end{equation*}
$$

where $y_{1}^{\prime}=y_{1} x_{21} f, y_{2}^{\prime}=v_{2} d t_{22}$, and $y_{3}^{\prime}=y_{3}$. The proof is given in Lemma 3 below. Assuming this result we next show that all the conditions of Lemma 2 apply to (21) and (22).

First, $x_{2}^{\prime}=s_{22}$ is a proper factor of $x_{2}$ and $y_{2}^{\prime}=v_{2} d t_{22}$ is a proper factor of $y_{2}$. Hence $x_{2}^{\prime}$ and $y_{2}^{\prime}$ contain no singularities of $x$. Second, $x_{2}^{\prime}$ and $y_{2}^{\prime}$ are coterminal. Third, $y \sim y^{\prime}$ (Lemma 3) implies $y_{2} \sim y^{\prime}$ and so $x_{2} \sim y^{\prime}$. Finally, we verify the four conditions on the alphabets of the factors:

$$
\begin{equation*}
x_{1}^{\prime} \tau=\left(x_{1} x_{21} f\right) \tau=\left(y_{1} x_{21} f\right) \tau=y_{1}^{\prime} \tau . \tag{i}
\end{equation*}
$$

(ii) $\quad\left(x_{1}^{\prime} x_{2}^{\prime}\right) \tau=\left(x_{1} x_{2}\right) \tau=\left(y_{1} y_{2}\right) \tau=(q d) \tau \cup t_{22} \tau$

$$
\begin{aligned}
& =(p c) \tau \cup t_{22} \tau=\left(x_{1} x_{21} f\right) \tau \cup t_{22} \tau \\
& \quad=\left(y_{1} x_{21} f\right) \tau \cup t_{22} \tau=\left(y_{1} x_{21} f\right) \tau \cup\left(v_{2} d\right) \tau \cup t_{22} \tau,
\end{aligned}
$$

because $\left(v_{2} d\right) \tau \subset\left(y_{1} y_{2}\right) \tau$. Therefore:

$$
\left(x_{1}^{\prime} x_{2}^{\prime}\right) \tau=\left(y_{1} x_{21} f v_{2} d t_{22}\right) \tau=\left(y_{1}^{\prime} y_{2}^{\prime}\right) \tau .
$$

(iii)

$$
x_{3}^{\prime} \tau=x_{3} \tau=y_{3} \tau=y_{3}^{\prime} \tau .
$$

(iv) Since $y_{1}^{\prime}$ ends in $f$ which ends in $c, e \in\left(y_{2}^{\prime} y_{3}^{\prime}\right) \tau$ implies vol. $20, \mathrm{n}^{\circ} 2,1986$

Figure 2. - Illustrating Factorizations of $x$ and $y$.
$(c, e) \in y^{\prime} \tau_{2}=x \tau_{2}$. Hence $e \in\left(s_{22} x_{3}\right) \tau$, because $c \notin p \tau$. Therefore $\left(y_{2}^{\prime} y_{3}^{\prime}\right) \tau \subset\left(x_{2}^{\prime} x_{3}^{\prime}\right) \tau$.

Conversely:

$$
\left(x_{2}^{\prime} x_{3}^{\prime}\right) \tau=\left(s_{22} x_{3}\right) \tau \subset\left(x_{2} x_{3}\right) \tau=\left(y_{2} y_{3}\right) \tau=\left(y_{21} g t_{22} y_{3}\right) \tau
$$

By Proposition 6 applied to the letter $d$ in $g,\left(y_{21} g\right) \tau \subset\left(t_{22} y_{3}\right) \tau$. Hence $\left(x_{2}^{\prime} x_{3}^{\prime}\right) \tau \subset\left(t_{22} y_{3}\right) \tau \subset\left(y_{2}^{\prime} y_{3}^{\prime}\right) \tau$. Thus $\left(x_{2}^{\prime} x_{3}^{\prime}\right) \tau=\left(y_{2}^{\prime} y_{3}^{\prime}\right) \tau$.

Informatique théorique et Applications/Theoretical Informatics and Applications

Now all the conditions of Lemma 2 are satisfied. Since $\left|x_{2}^{\prime}\right|+\left|y_{2}^{\prime}\right|<\left|x_{2}\right|+\left|y_{2}\right|$, the induction hypothesis applies and

$$
y^{\prime}=y_{1}^{\prime} y_{2}^{\prime} y_{3}^{\prime} \sim y_{1}^{\prime} x_{2}^{\prime} y_{3}^{\prime}=y_{1} x_{21} f s_{22} y_{3}=y_{1} x_{2} y_{3} .
$$

Therefore $y \sim y^{\prime} \sim y_{1} x_{2} y_{3}$ as claimed, and the induction step goes through.
Case 3: $x_{2} \tau \notin x_{3} \tau$
This follows from Case 2 by left-right duality.
Since the induction step goes through in all cases, the lemma holds.
Lemme 3: Let $x, y$, and $y^{\prime}$ be defined as in the proof of Lemma 2. Then $y \sim y^{\prime}$.

Proof: (a) We first show that the graph consisting of the edges in $C=f \tau \cup g \tau$ is strongly connected. Since the node $b \omega$ is connected to $a \alpha=f \alpha$ by the path $t_{1}$, all the nodes in the path $a s_{1} b$ are connected to $f \alpha$. Let $s_{21}=s_{21}^{\prime} s_{21}^{\prime \prime}$ where $s_{21}^{\prime}$ is the longest prefix of $s_{21}$ that is connected to $f \alpha$. Similarly, $a \omega$ is connected to $b \alpha=g \alpha$ by $s_{1}$. Let $t_{21}=t_{21}^{\prime} t_{21}^{\prime \prime}$ where $t_{21}^{\prime}$ is the longest prefix of $t_{21}$ connected to $g \alpha$ (see Fig. 3).

Figure 3.
Now $s_{21}^{\prime \prime}$ cannot have any edges in common with $a s_{1} b s_{21}^{\prime}$ or $b t_{1} a t_{21}^{\prime}$. Otherwise the $\omega$ end of the common edge could be connected to $f \alpha$. Hence:

$$
s_{21}^{\prime \prime} \tau \cap\left(b t_{1} a t_{21}^{\prime}\right) \tau=\varnothing .
$$

Also, $(p c) \tau \supset(q d) \tau$, i. e.:

$$
\left(x_{1} x_{21} a s_{1} b s_{21}^{\prime}\right) \tau \cup s_{21}^{\prime \prime} \tau \supset\left(y_{1} y_{21} b t_{1} a t_{21}^{\prime}\right) \tau=\left(y_{1} y_{21}\right) \tau \cup\left(b t_{1} a t_{21}^{\prime}\right) \tau
$$

vol. $20, n^{\circ} 2,1986$

Consequently we have:

$$
\left(x_{1} x_{21} a s_{1} b s_{21}^{\prime}\right) \tau \supset\left(y_{1} y_{21} b t_{1} a t_{21}^{\prime}\right) \tau .
$$

Similarly the reverse inclusion holds and:

$$
\left(x_{1} x_{21} a s_{1} b s_{21}^{\prime}\right) \tau=\left(y_{1} y_{21} b t_{1} a t_{21}^{\prime}\right) \tau \supset B=\left(a s_{1}\right) \tau \cup\left(b t_{1}\right) \tau .
$$

Therefore $\left(x_{1} x_{21} a s_{1} b s_{21}^{\prime}, y_{1} y_{21} b t_{1} a t_{21}^{\prime}\right)$ is a $B$-pair. However ( $p c, q d$ ) is a minimal $B$-pair. Hence we must have $s_{21}^{\prime}=s_{21}, t_{21}^{\prime}=t_{21}, f \omega$ is connected to $f \alpha$ and $g \omega$ is connected to $g \alpha$. Hence the graph is strongly connected since $f$ and $g$ have a common edge.
(b) In view of (a) there exists paths $h$ and $k$ such that:

$$
\begin{array}{rll}
h \alpha=f \omega, & h \omega=f \alpha, & h \tau \subset C, \\
k \alpha=g \omega, & k \omega=g \alpha, & k \tau \subset C .
\end{array}
$$

Let $f=u_{2} c h$ and $g^{\prime}=v_{2} d k$. Then $\mathrm{f}^{\prime} f g^{\prime} g$ is a loop about the vertex $d \omega=g \omega$ and $f^{\prime} f g^{\prime} g \subset C$. Now:

$$
\begin{aligned}
y & =y_{1} y_{21} g t_{22} y_{3} \\
& \sim\left(y_{1} y_{21} g\right)\left(f^{\prime} f g^{\prime} g\right)^{3} t_{22} y_{3}
\end{aligned}
$$

by $(1 a)$, because $\left(y_{1} y_{21} g\right) \tau=(q d) \tau=(t c) \tau \supset C$, and $C \subset\left(t_{22} y_{3}\right) \tau$ by Proposition 6. Thus:

$$
\begin{aligned}
& \sim y_{1} y_{21} g\left(f^{\prime} f g^{\prime} g\right)^{3} t_{22} y_{3} \\
& =y_{1} y_{21}\left(g f^{\prime}\right)\left(\left(f g^{\prime}\right)\left(g f^{\prime}\right)\right)^{2} f g^{\prime} g t_{22} y_{3} \\
& =\left[y_{1}\right]\left[y_{21}\left(g f^{\prime}\right)\right]\left[\left(f g^{\prime}\right)\left(g f^{\prime}\right)\right]^{2}\left[f g^{\prime} g t_{22} y_{3}\right] .
\end{aligned}
$$

Now Rule (1c) can be applied, yielding:

$$
y \sim y_{1} x_{21}\left(f g^{\prime} g f^{\prime}\right)^{2} f g^{\prime} g t_{22} y_{3}
$$

where we have replaced $y_{21} g f$ by $x_{21}$. The alphabet conditions on $x_{21}$ and $y_{21}$ are easily verified. Thus: $x_{21} f v_{2} d t_{22} y_{3}$,

$$
\begin{aligned}
y & \sim y_{1} x_{21}\left(f g^{\prime} g f^{\prime}\right)^{2} f g^{\prime} g t_{22} y_{3} \\
& =y_{1} x_{21} f g^{\prime}\left(g f^{\prime} f g^{\prime}\right)^{2} g t_{22} y_{3} \\
& \sim y_{1} x_{21} f g^{\prime} g t_{22} y_{3}, \quad \text { by Rule }(1 a) \\
& =y_{1} x_{21} f v_{2} d\left(k v_{1} c v_{2} d\right) t_{22} y_{3} \\
& \sim y_{1} x_{21} f v_{2} d t_{22} y_{3}, \quad \text { by Rule }(1 a) \\
& =y^{\prime} .
\end{aligned}
$$

Hence the lemma holds.
This concludes the proof of Lemmas 2 and 3. By combining Lemmas 1 and 2 we have the theorem.
